The Building 1065/1027 Area consists of Buildings 1027, 1040, 1047, 1062, 1063, the former location of Building 1065, and areas near these buildings (Figure A-11-1). Building operations formerly associated with the Building 1065/1027 Area include a power house/steam plant, laundry, warehouse, exchange service station, post exchange auto shed/maintenance/paint shop, and a garage (Montgomery Watson, 1997). A gas station shown on a 1921 map was also identified at a location just south of Building 1040 (Army, 1921).

Building 1027 formerly had a 10,000-gallon fuel oil underground storage tank (UST), which was removed in 1993. Following the tank removal, approximately 170 cubic yards of soil were removed and confirmation samples were collected. The analytical results of the confirmation samples indicated that TPHd was present in the soil at concentrations of 1.4 and 1.6 milligrams per kilogram (mg/kg). BTEX compounds were not detected in any soil confirmation samples (Montgomery Watson, 1996c).

During five sampling events conducted prior to May 1996, TPH was not detected in monitoring wells 1027MW01 and 1027MW03. Therefore, since May 1996, these wells have been utilized for elevation monitoring only. Beginning in September 1997, groundwater samples collected from the other site wells have been analyzed for TPH, BTEX, iron, manganese, general water chemistry, and natural attenuation parameters. Dissolved metals, general water chemistry, and natural attenuation parameters were eliminated from the groundwater monitoring program for the Building 1065/1027 Area in May 1999.

To evaluate changing redox conditions, pH, temperature and ORP were added to the program in the First Quarter 2006. The *Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California* (MACTEC, 2006), concluded that ORP is a good indicator for evaluating changing redox conditions. The First Quarter 2006 pH, temperature and ORP data are presented in Table A-11-1 and will be used in the ongoing redox evaluations at CAP sites.

Summaries of dissolved oxygen, TPH, BTEX, MTBE, and dissolved metals results are presented in Tables A-11-1 through A-11-6.

The planned installation of a recycled water treatment and distribution system is currently on hold.

2.0 SITE DESCRIPTION AND GEOLOGY

The Building 1065/1027 Area is located in the Northeastern Groundwater Area of the Marina Groundwater Basin (Figure 1). Results of a previous site investigation conducted at the Building 1065/1027 Area indicate that units, which had previously been identified as the shallow/intermediate, intermediate, and deep groundwater zones, appear to be in hydraulic connection. These units are therefore considered to be one hydrogeologic unit called the intermediate groundwater zone. Data presented in the *Interim Data Report, Building 1065 Area* indicate that there does not appear to be a continuous aquitard separating the shallow/intermediate sand and intermediate sand or an aquitard separating what was formerly identified as the "intermediate" and "deep" sand units (now referred to as "upper intermediate sand" and "lower intermediate sand") (MACTEC, 2003a). The shallow groundwater zone consists of saturated portions of the fill and, where present, the shallow sand. The intermediate zone consists of the intermediate/shallow sand, upper intermediate sand and lower intermediate sand (identified in previous reports as deep sand). Groundwater levels within wells screened in the intermediate sand unit indicate that it is confined to semi-confined. Comparison of water levels in adjacent shallow zone and intermediate zone well pairs shows that there is an upward vertical gradient between the intermediate and shallow groundwater zones in the northern and central portions of the site (Mactec, 2003a). The shallow zone extends from approximately 6 to 12 feet bgs, and the intermediate zone extends from approximately 17 to 29 feet bgs. The depth of the deep zone was not defined during the Site Investigation (SI) conducted in 1997 (IT, 1997b). Groundwater has been reported to follow the general northward topographic trend towards the San Francisco Bay (Montgomery Watson, 1997).

Subsurface materials beneath the Building 1065/1027 Area consist of artificial fill, clayey silty sands, clayey silt, and sand. Building 1027 is underlain by silty sand to an approximate depth of 15 feet bgs. A brown, medium dense clayey sand is located beneath the silty sand (Montgomery Watson, 1996c). Fill material within the Building 1065/1027 Area ranges from 1 to 5.5 feet in thickness. The fill is underlain by native clayey silty sand with an average thickness of 3 feet. The clayey silty sand is underlain by a 9-foot-thick clayey silt (Bay Mud) deposit. Beneath the Bay Mud, a sand layer is present to a depth of approximately 25 feet bgs in some areas and is underlain by a second layer of Bay Mud to depths of approximately 29 feet bgs. Dense sands underlie the second Bay Mud horizon (IT, 1997b, Mactec, 2003a).

3.0 BUILDING 1065/1027 SITE INVESTIGATION

From August to November 2002, Mactec Engineering and Consulting Incorporated (MACTEC) conducted an additional SI at the Building 1065/1027 Area. The SI was conducted to fill data gaps that were identified from previously collected data and included soil and groundwater sampling and abandonment of six existing installation of seven new piezometers.

Free product was not encountered in any of the borings or during any of the piezometer installations. Results from the SI were presented to the RWQCB and DTSC in the *Interim Data Report, Building 1065 Area, Presidio of San Francisco, California* (MACTEC, 2003a). The RWQCB and DTSC granted concurrence to the Interim Data Report on 7 May 2003.

An Interim Action Plan was prepared (MACTEC, 2003b) and was implemented by the Trust in November 2003. The interim action consisted of excavating and disposing of approximately 5,582 tons of petroleum impacted soil to Class II and Class III landfills for disposal. The extent of the excavation was approximately 100 by 130 feet and ranged in depth from 8 to 12 feet (Figure A-11-1).

4.0 DRAFT CORRECTIVE ACTION PLAN BUILDING 1065 AREA

The *Draft Corrective Action Plan, Building 1065 Area* (CAP) (Mactec, 2005b) was submitted to all stakeholders for public review in 29 July 2005. The following chemicals were identified by the CAP as chemicals of concern in soil: TPHg, TPHd, TPHfo, VOCs (benzene, ethylbenzene, 2-hexanone, and toluene), PAHs (benzo(a)pyrene, and metals (arsenic, cadmium, lead and zinc). Additionally, the following chemicals were identified by the CAP as chemicals of concern in groundwater: TPHg, benzene, arsenic, and antimony.

Based on cleanup level exceedances, three Soil Remedial Units (RUs) (Soil RUs A, B, and C) and one Groundwater RU (Groundwater RU A) were identified in the CAP. The Soil RUs are described in the CAP. The Groundwater RU in the same location as Soil RU A and is believed to be associated with Soil RU A, therefore, these two RUs have been combined. The Groundwater RU A is comprised of shallow groundwater between 6 and 12 feet bgs beneath and adjacent to the south wall of Building 1063. The groundwater in this area contains TPHg and benzene above their applicable CAP cleanup levels (MACTEC, 2005b).

The CAP recommends *Excavation and Offsite Disposal of Soil, Application of In Situ Oxygen Release Product As Necessary, Groundwater Monitoring* as the preferred corrective action alternative for Soil and Groundwater RU A. This corrective action will be implemented in May 2006, as detailed in the CAP (MACTEC, 2005b).

Groundwater sampling at the Building 1065 Area will be conducted in accordance with the CAP following CAP approval and implementation. Cleanup levels proposed in the Draft CAP are presented in Tables A-11-3 and A-11-4.

5.0 GROUNDWATER MONITORING

The Building 1065/1027 Area has 23 associated monitoring wells and piezometers. Twenty-two monitoring wells and piezometers were sampled during the First Quarter 2006, in accordance with Table 1A. Piezometer 1065PZ6A was not sampled as scheduled due to an obstruction covering the location.. Five monitoring wells (1065MW9A, 1065MW9B, 1065MW101, 1065MW102, and 1047MW101) and five piezometers (1065PZ1A, 1065PZ1B, 1065PZ2A, 1065PZ4A, and 1065PZ5AR) were sampled during the Second Quarter 2006, in accordance with Table 1B.

Monitoring wells and piezometers associated with the Building 1065/1027 Area are screened within the shallow unconfined, and the intermediate semi-confined zones. During the First and Second Quarters 2006, groundwater elevations were measured in 22 site piezometers and monitoring wells (Tables 1A and 1B).

5.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 6 March and 22 May 2006 at 22 Building 1065/1027 Area piezometers and wells that were scheduled to be measured as part of this program (Tables 1A and 1B). A list of site wells and piezometers monitored and corresponding groundwater levels are provided in Table A-11-7. Water level meters were calibrated on 6 March and 22 May 2006. The calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

5.1.1 Shallow Groundwater

During the First Quarter 2006, shallow groundwater elevations ranged from 7.51 to 16.10 feet above PLLW in monitoring wells 1065MW101 and 1047MW101, respectively (Figure A-11-2). During the Second Quarter 2006, shallow groundwater elevations ranged from 7.37 to 15.20 feet above PLLW in monitoring wells 1065MW101 and 1047MW101, respectively (Figure A-11-3). Groundwater elevation measurements at the Building 1065/1027 Area shallow aquifer monitoring wells were evaluated with measurements collected at Building 231/207 and Fill Site 6 shallow monitoring wells to better understand groundwater flow direction and gradients in this area. Groundwater elevation data for these adjacent sites can be found in Tables A-10-7 and A-3-6.

The shallow aquifer groundwater flow direction in the Building 1065/1027 Area was generally north to northeast towards the San Francisco Bay during both the First and Second Quarters 2006, which follows the general topographic trend (Figures A-11-2 and A-11-3). The shallow groundwater gradient in this area was calculated to be approximately 0.024 feet per foot during the First Quarter 2006, and approximately 0.020 feet per foot during the Second Quarter 2006. The overall groundwater gradients and flow directions observed during the First and Second Quarters 2006 are consistent with gradients and flow directions observed prior to the

construction dewatering activities that occurred during the adjacent letterman hospital redevelopment.

5.1.2 Intermediate Groundwater

During the First Quarter 2006, intermediate groundwater elevations ranged from 12.34 to 15.34 feet above PLLW in piezometers 1065PZ4B and 1065PZ5B, respectively (Figure A-11-4). During the Second Quarter 2006, intermediate groundwater elevations ranged from 11.82 to 16.09 feet above PLLW in piezometers 1065PZ4B and 1065PZ6B, respectively (Figure A-11-5).

Groundwater elevation measurements from the Building 1065/1027 Area intermediate monitoring wells were evaluated with measurements collected from Building 231/207 intermediate aquifer monitoring wells to better understand groundwater flow direction and gradients in this area. Monitoring well data for the Building 231/207 Area site can be found in Table A-10-3. During the First and Second Quarters 2006, the intermediate aquifer groundwater flow direction in the Building 231/207 and Building 1065/1027 Area was generally to the north on the eastern portion of the site and northwest on the western portion of the site. Groundwater beneath the Building 1065/1027 Area flows in a northerly direction towards the San Francisco Bay following the general topographic trend (Figures A-11-4 and A-11-5). During both the First and Second Quarters 2006, the average intermediate groundwater gradient in the vicinity of Building 1065/1027 Area was estimated to be approximately 0.007 feet per foot. Groundwater gradients and flow directions remain consistent with previous findings at the site.

5.2 Groundwater Purging and Sampling

During the First Quarter 2006, all Building 1065/1027 Area piezometers and monitoring wells proposed for sampling were purged and sampled between 7 March and 16 March 2006. During the Second Quarter 2006, all Building 1065/1027 Area piezometers and monitoring wells proposed for sampling were purged and sampled between 24 May and 25 May 2006. All piezometers and wells were purged and sampled using the methods shown in Tables 1A and 1B and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

All samples were collected using methods shown in Tables 1A and 1B and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, purging volumes, purge water general water chemistry parameters, and sampling equipment for each piezometer and monitoring well are described in the purge records at the conclusion of this section. Purge water was stored for future disposal in a 2,800-gallon aboveground polyethylene storage tank, located at the Central Magazine.

5.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this Appendix A subsection.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed for the First and Second Quarters 2006.

6.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected during the First and Second Quarters 2006 at the Building 1065 Area were analyzed for all or a combination of general chemistry parameters, TOC, dissolved metals, TDS, dissolved oxygen, VOCs, BTEX, MTBE, total sulfides, TPHg, TPHd, TPHfo, and/or TPHss. Specific lists of analyses for monitoring wells and piezometers are detailed in Tables 1A and 1B. Additionally, redox (pH, ORP and temperature) parameters were measured within wells sampled during the First and Second Quarters 2006.

The TPHfo standard currently being used is a TPH as motor oil standard, as defined by the Presidio QAPP, with a carbon range of C_{24}-C_{36}. Section 5.4.3.1 in the main report discusses the data compatibility issues associated with TPH analyses.

6.1 Dissolved Oxygen

Dissolved oxygen measurements are presented in Table A-11-1. The dissolved oxygen measurements ranged from 0.05 to 4.87 mg/L at 1065PZ1B and 1065MW102 during the First Quarter 2006 and from 0.14 to 4.21 mg/L at 1065PZ2A and 1065PZ5AR during the Second Quarter 2006.

The dissolved oxygen concentrations within the remaining Building 1065/1027 Area monitoring wells and piezometers were generally within the range of historical concentrations. During the First Quarter 2006, dissolved oxygen was measured at new low concentrations of 0.05 and 0.12 mg/L within piezometers 1065PZ51B and 1065PZ2B, respectively, and at new high concentrations of 0.82 and 4.87 mg/L within monitoring wells 1065MW101 and 1065MW102, respectively. During the Second Quarter 2006, dissolved oxygen was measured at a new low concentration of 0.36 mg/L within monitoring well 1065MW9B and at new high concentration of 4.21 mg/L within piezometer 1065PZ5AR. The new high concentrations within monitoring well 1065MW102 and piezometer 1065PZ5AR were significantly higher than previous concentrations at these locations. Dissolved oxygen concentrations will continue to be monitored during future sampling events to determine apparent trends. The remaining new high

and low concentrations were only slightly higher or lower than the previously measured concentrations and can be attributed to natural fluctuations.

6.2 General Chemistry Results

The following table summarizes new high and low general chemistry analytical results for the First and Second Quarters 2006 within the Building 1065 Area when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
1065PZ1B	Alkalinity, Total	15 / 15	310	406	230	--	mg/L

Qualified data in the table above is indicated with an asterisk (*).

Significant new high and low general chemistry results are discussed below.

Chloride was detected at concentrations significantly lower than previously detected within the primary and duplicate samples from monitoring well 1047MW101 during the First Quarter 2006.

Nitrate as nitrogen was detected within 1065PZ3A during the First Quarter 2006 at a concentration of 0.17 mg/L, which is significantly lower than previously reported within this well.

Fluoride was detected during the First and/or Second Quarters 2006 in samples collected from 1065PZ1A, 1065PZ2A, 1065PZ3A, 1065PZ4A, 1065PZ5AR, 1065PZ7B, 1065MW9A, 1065MW11A, 1065MW101, 1065MW102 at concentrations ranging from 0.11 to 0.54 mg/L. Nitrite as nitrogen was not detected within any Building 1065 Area monitoring wells or piezometers groundwater samples analyzed during the First and Second Quarter 2006. Sulfide was detected during the First and/or Second Quarters 2006 in samples collected from 1065PZ1B, 1065PZ7B, 1065MW9A, and 1065MW102 at concentrations ranging from 0.04 to 0.17 mg/L. Sulfide was detected at a concentration of 0.17 mg/L in the QC duplicate sample collected from 1065MW9A during the Second Quarter 2006. Sulfide was not detected within either the primary or the duplicate samples collected from this well during the same quarter. The RPD between the primary, duplicate and the QC duplicate samples exceeds the QAPP-specified 50% criteria, as described in the Second Quarter 2006 DataVal report presented in Appendix D.

Fluoride, nitrite and sulfide analysis at the Building 1065 Area began in 2005. Apparent trends in fluoride, nitrite and sulfide will be evaluated when a sufficient amount of data has been collected. Many of the new highs and lows for these constituents are related to the small number of sampling events.

The remaining new high and low concentrations from the First and Second Quarters 2006 can be attributed to natural fluctuations and are not considered significant. An evaluation of the redox state of site groundwater and relative general chemistry results can be found in Section 8.0.

6.3 Dissolved Gas and TOC Results

TOC was detected in all Building 1065 Area monitoring wells and piezometers for which it was analyzed during the First Quarter 2006 (Table A-11-5). During the First Quarter 2006, TOC

concentrations ranged from 2.1 to 43.5 mg/L in 1065MW9A and 1065PZ5AR, respectively. TOC was not measured during the Second Quarter 2006.

Dissolved gases (ethane, ethene, and methane) were removed from the program for evaluation of redox conditions, in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, pending).

An evaluation of the redox state of site groundwater and TOC results can be found in Section 8.0.

6.4 Dissolved Metals Results

All Building 1065 Area groundwater samples collected were analyzed for the 15 dissolved metals list defined in Tables 1A and 1B during the First and Second Quarters 2006, except monitoring well 1047MW101, which was not analyzed for dissolved metals during the Second Quarter 2006. Dissolved metals results are presented in Table A-11-4 and are discussed below.

The tables below summarize new high and low dissolved metal analytical results for the First and Second Quarters 2006 within Building 1065 Area monitoring wells and piezometers when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed. Only the new high or the new low concentrations are shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
1065PZ1A	Copper	4 / 11	< 1	2.1	--	2.6	µg/L
	Magnesium	6 / 6	40,000	49,000	--	51,000	µg/L
	Sodium	6 / 6	110,000	190,000	--	220,000	µg/L

Qualified data in the table above is indicated with an asterisk (*).

The majority of the new high or low detections were only slightly higher or lower than previous highs and lows or are the results of the relatively few groundwater samples collected for certain metals and are not considered significant. Significant dissolved metals detections are discussed below.

- Dissolved arsenic was detected in eight of the 23 monitoring wells and piezometers sampled and analyzed for arsenic by EPA Method 6010/6020 during the First Quarter

2006. Dissolved arsenic was detected in seven of the 10 monitoring wells and piezometers sampled and analyzed for arsenic by EPA Method 6010/6020 during the Second Quarter 2006.

- Dissolved arsenic was detected at concentrations above its applicable cleanup level within 1065PZ1A, 1065PZ2A, 1065PZ5AR, and 1065MW101, during the First Quarter. Dissolved arsenic was detected at concentrations above its applicable cleanup level within 1065PZ1A, 1065PZ2A, 1065PZ5AR, 1065MW101, and 1065MW102 during the Second Quarter 2006. Dissolved arsenic was detected in one intermediate well during the First Quarter 2006 and only in shallow piezometers and wells in the Second Quarter 2006.
- Dissolved cadmium was detected at a new high concentration of 1.1 µg/L during the First Quarter 2006 within piezometer 1065PZ7A. This is the first time that cadmium has been detected since analysis for this metal began in the Third Quarter 2000 at this location.
- Dissolved calcium was detected at new low concentrations of 35,000 and 16,000 µg/L during the First Quarter 2006, within piezometer 1065PZ3A and monitoring well 1065MW11A, respectively.
- Dissolved chromium was detected at a new high concentration of 19 µg/L within piezometer 1065PZ7A during the First Quarter 2006. This is the first time that chromium has been detected since analysis for this metal began in the Third Quarter 2000 at this location. Dissolved chromium was not detected above the reporting limit for the first time within piezometer 1065PZ7B during the First Quarter 2006.
- Dissolved copper was detected within four Building 1065 Area monitoring wells and piezometers during the First and Second Quarters 2006 at concentrations ranging from 1.2 to 2.6 µg/L with a number of new high and low concentrations.
- Dissolved iron had many new high concentrations in the First and Second Quarters 2006. Iron was detected within 18 of the Building 1065/1027 Area monitoring wells and piezometers sampled during the First Quarter 2006 at concentrations ranging from 110 to 29,000 µg/L. The dissolved iron concentrations detected within shallow monitoring wells were generally higher than the concentrations observed in intermediate samples.
- Dissolved iron was detected during the Second Quarter 2006 at concentrations ranging from 120 to 23,000 µg/L.
- In primary and QC split duplicates samples, 1065PZ5AR and 1065PZ5ARCL, the RPD between the reported iron results failed the 50% RPD acceptance criteria for dissolved iron at 56%. As described in the First Quarter 2005 DataVal report presented in Appendix D.
- Dissolved lead was not detected above laboratory reporting limits within any of the Building 1065 Area piezometers or monitoring wells sampled during the First and Second Quarters 2006.

- Dissolved nickel was detected at a concentration of 33 µg/L within monitoring well 1065MW102 during the First Quarter 2006. This is significant as it is the first time that nickel has been detected since analysis for this metal began in the Third Quarter 2004.
- Dissolved zinc was detected above laboratory limits at concentrations of 23 and 25 µg/L within piezometer 1065PZ5B and in the primary sample from monitoring well 1065MW9B, respectively, during the First Quarter 2006. Dissolved zinc was detected above laboratory limits at concentrations of 40 and 26 µg/L within piezometers 1065PZ1A and 1065PZ4A, respectively, during the Second Quarter 2006. The detections within1065PZ5B, 1065PZ1A, and 1065PZ4A are significant, as zinc has not been detected at these locations during previous Quarters.

Dissolved arsenic, iron and manganese concentrations are typically found at elevated concentrations within the same sample locations because as the groundwater environment becomes more reducing arsenic, iron and manganese oxides undergo reduction and become more mobile/soluble in groundwater.

The predominate condition that can cause a release of arsenic and iron from the soil into the groundwater (cause it to become more soluble) is the presence of a reducing environment, where soluble materials tend to accept electrons from the water. A reducing environment can cause arsenic to become more soluble in two ways. The first is the reduction of Arsenic V to Arsenic III, which is less easily adsorbed to soil. The other is reduction and dissolution (dissolving) of ferric iron, which releases arsenic and iron that had been adsorbed to the soil (Suthersan and Payne, 2005).

Dissolved arsenic and iron concentrations were observed to drop during the Fourth Quarter 2004 within 1065PZ1A and 1065PZ2A, which are located downgradient of the interim removal action conducted in November 2003. The drop in concentration during the Fourth Quarter 2004 was believed to be a result of the interim remedial action excavation activities. However, a rebound in arsenic and iron concentrations within these piezometers is currently occurring. Dissolved arsenic and iron concentrations will continue to be monitored downgradient of the interim removal action and new trends will be identified as they become apparent.

6.5 VOCs, BTEX and MTBE Results

All Building 1065 Area monitoring wells and piezometers were sampled for either BTEX or VOCs during the First Quarter 2006 (Table A-11-3). Two piezometers (1065PZ1A and 1065PZ1B) and three monitoring wells (1065MW101, 1065MW102, and 1047MW101) were analyzed for VOCs during the Second Quarter 2006. Additionally, three piezometers (1065PZ2A, 1065PZ4A, and 1065PZ5AR) and two monitoring wells (1065MW9A and 1065MW9B) were analyzed for BTEX and MTBE during the Second Quarter 2006.

The tables below summarize new high and low dissolved VOC, BTEX and MTBE analytical results for the First and Second Quarters 2006 within Building 1065 Area monitoring wells and

piezometers when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed. Only the new high or the new low concentrations are shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
BTEX							
1065PZ1A	Benzene	1 / 32	< 0.5	< 0.5	--	0.09 *	µg/L
1065PZ5AR	Toluene	1 / 12	< 0.5	< 0.5	--	0.54 *	µg/L
Volatile Organic Compounds							
1065PZ2A	MTBE	3 / 23	< 2	5	--	7.1	µg/L
1065PZ5AR	MTBE	1 / 12	< 2	< 2	--	3.5 *	µg/L
1065PZ7A	MTBE	1 / 14	< 2	< 2	--	16	µg/L

Qualified data in the table above is indicated with an asterisk (*).

Significant new high and low general chemistry results are discussed below.

Benzene was detected at a concentration of 0.09 µg/L during the Second Quarter 2006 within piezometer 1065PZ1A, which is significant as benzene has not been detected previously in this piezometer.

Toluene was only detected within piezometer 1065PZ5AR at a primary sample concentration of 0.54 µg/L during the First Quarter 2006, which is significant as toluene has not been detected in this piezometer before. Toluene was not detected within either the duplicate or QC duplicate samples from this location. Toluene was not detected in any Building 1065 Area in samples during the Second Quarter 2006.

MTBE was detected at a concentration of 16 µg/L within the piezometer 1065PZ7A during the First Quarter 2006. The detected concentration of MTBE within 1065PZ7A exceeds the California Maximum Contaminant Level (MCL) of 13 µg/L. MTBE was also detected at concentrations of 7.1 and 3.5 µg/L during the Second Quarter 2006 within piezometers 1065PZ2A and 1065PZ5AR, respectively. The MTBE detections within 1065PZ7A and 1065PZ5AR are significant as MTBE has not been detected in these piezometers before.

No VOCs, BTEX or MTBE compounds were detected within any other monitoring wells or piezometers sampled for these analytes during either the First or Second Quarters 2006. The VOC and BTEX detections, with the exception of MTBE within 1065PZ7A, did not exceed cleanup levels (Table A-11-3).

6.6 TPH Results

All groundwater samples collected from the Building 1065 Area were analyzed for TPHg, TPHd, and TPHfo during the First and Second Quarters 2006, except for the samples from monitoring well 1047MW101, which were analyzed for TPHg and TPH as stoddard solvent (TPHss) only. TPH results and applicable CAP cleanup levels are summarized in Table A-11-3.

In accordance with new RWQCB Order No. R2-2003-0080 for the Presidio, the First and Second Quarters 2004 TPHg shallow groundwater analytical results are presented in Figures A-11-2 and A-11-3. TPHg isoconcentration contours for the First and Second Quarters 2006 have not been added to Figures A-11-2 and A-11-3 because an insufficient amount of TPHg concentrations were detected.

TPHg was detected in 1065PZ1A at concentrations of 86 and 160 µg/L during the First and Second Quarters 2006, respectively. The TPHg concentrations detected within 1065PZ1A during the First and Second Quarters 2006 are within the historical range of TPHg concentrations within this piezometer and are below the applicable cleanup level. The TPHg concentrations detected within 1065PZ1A during the First and Second Quarters 2006 are within the historical range of TPHg concentrations within this piezometer and are below the applicable cleanup level. TPHg was not detected within piezometer 1065PZ1A during the Fourth Quarter 2004, which is the first time TPHg had not been detected within this piezometer. Piezometer 1065PZ1A is located downgradient of the interim removal action that took place in November 2003. TPHg was not detected within this piezometer during the Fourth Quarter 2005, but has been present throughout 2005 and 2006. TPHd was detected in 1065PZ1A at a concentration of 58 µg/L during the First Quarter 2006, which is significant because this is the first time TPHd has been detected within this piezometer since 2001.

TPHg was detected in the sample collected from 1065MW11B at a concentration of 190 µg/L during the First Quarter 2006, which is significant because this was the first time TPHg had been detected within this monitoring well. Future concentrations of TPH at this location will continue to be monitored and trends identified as they become apparent.

TPHg was detected in the primary sample collected from 1047MW101 at a concentration of 51 µg/L during the First Quarter 2006. TPHg was not detected within the duplicate or the QC duplicate samples collected from 1047MW101 during the First Quarter 2006, nor was it detected in the Second Quarter 2006.

TPHd was detected at concentration 55 µg/L in monitoring well 1065MW10A, which is significant because this was the first time TPHd had been detected within this monitoring well. Future concentrations of TPH at this location will continue to be monitored and trends identified as they become apparent.

No other TPH compounds were detected in any other groundwater samples collected from Building 1065 Area wells or piezometers during the First or Second Quarters 2005 (Figures A-11-2 and A-11-3).

7.0 GROUNDWATER REDOX EVALUATION

Several parameters were measured in the field and in the laboratory to help determine the redox state of groundwater at the Building 1065 Area. The following parameters were included in the groundwater monitoring program at the Building 1065 Area during the First and Second Quarters 2006 and are indicators of changing redox potential within groundwater. ORP measurements are located in the purge records, which are located at the conclusion of this section. The analytes and their use, in terms of determining the current redox state of site groundwater, are listed below.

- **Dissolved Oxygen** – Dissolved oxygen is a field measurement that is collected using a flow through cell or a down-hole probe. Low dissolved oxygen concentrations are typically associated with low redox potential and reducing environments. Dissolved oxygen in the presence of organic carbon is consumed by microorganisms during biodegradation processes and therefore low dissolved oxygen concentrations are indicative of microbial activity.

- **ORP** – ORP is a measurement that is collected in the field with the use of a flow through cell. Groundwater is pumped directly from the aquifer into the flow through cell without being exposed to air. The ORP is then measured by sensors within the flow through cell and recorded. ORP is a direct measurement of redox potential. However, ORP is not equivalent to redox potential. Depending on the type of sensor used and the temperature of the water, redox potential (eH) can be calculated. In general, the lower the ORP values the more reducing the water is, where as, the greater the ORP value the more oxidizing the water is. ORP measurements are recorded on the monitoring well purge records.

- **Nitrate/Nitrite** – The process of denitrification reduces nitrate to nitrite, which is ultimately reduced to nitrogen gas in reducing environments. A decreasing nitrate concentration trend in groundwater can be indicative of low redox potential, microbial metabolism and a reducing environment. Increasing concentrations of nitrate are typically associated with a rising redox potential.

- **Sulfate/Sulfide** – Decreasing concentrations of sulfate indicate sulfate reduction is taking place due to a reducing environment. Decreasing concentrations of sulfate are usually associated with sulfide production (i.e. sulfide is a product of sulfate reduction) and the repeated presence of sulfide in groundwater further confirms that sulfate is being reduced.

- **TOC** – Decreasing trends in TOC over time indicate that microbial metabolism is taking place and TOC is being consumed.

- **Dissolved Arsenic, Iron and Manganese** – Increasing concentrations of arsenic, iron, and/or manganese can be typically associated with a decreasing redox potential. Decreasing concentrations of these metals in association with increasing sulfate concentrations can be associated with an increasing redox potential.

The majority of the above analytes and field measurements, were collected within all Building 1065 Area monitoring wells proposed for sampling during the First and Second Quarters 2006.

The following analytical results were detected during the First and Second Quarters 2006 and provide an indication of the groundwater redox state at Building 1065/1027.

- Dissolved oxygen concentration measurements during the First Quarter 2006, ranged from 0.05 to 4.87 mg/L, and in the Second Quarter 2006 from 0.14 to 4.21 mg/L. Dissolved oxygen measurements fluctuated within the shallow and intermediate zone in both the First and Second Quarter when compared to previous data and there was no clear trend between dissolved oxygen levels versus zone.

- Nitrate was detected more often at higher concentrations in the intermediate zone wells and piezometers.

- Nitrite was not detected within any Building 1065/1027 monitoring wells sampled during the First or Second Quarters 2006 (Table A-11-2).

- Sulfate was detected in the majority of groundwater samples collected from Building 1065/1027 during the First and Second Quarters 2006.

- Sulfide was detected at three locations during the First and/or Second Quarters 2006 at concentrations ranging from 0.04 to 0.17 mg/L.

- TOC was detected in all Building 1065 Area monitoring wells and piezometers for which it was analyzed during the First Quarter 2006. During the First Quarter 2006, TOC concentrations ranged from 2.1 to 43.5 mg/L in 1065MW9A and 1065PZ5AR, respectively. TOC was not measured during the Second Quarter 2006.

In addition to the above evaluation, modified redox diagrams were developed for each Building 1065 Area monitoring well/piezometer sampled for redox parameters. The redox diagrams were generated using the Sequence™ program and concentrations of shallow and intermediate zone dissolved oxygen, nitrate, manganese, iron, sulfate and methane and are plotted on Figures A-11-6 and A-11-7, respectively. Each redox diagram consists of multiple axes, with each individual axis representing one of the above analytes. Each redox diagram is associated with one monitoring location. The relative shape of each redox diagram represents an approximation of the redox state within the location studied. In general, the larger the polygon

the more oxidizing the groundwater environment is at the well location, conversely, the smaller the polygon the more reducing the environment. Building 1065 Area redox diagrams (Figures A-11-6 and A-11-7) illustrate the differing redox environments across the site.

8.0 CONCLUSIONS AND RECOMMENDATIONS

Dissolved arsenic and iron concentrations were observed to drop during the Fourth Quarter 2004 within 1065PZ1A and 1065PZ2A, which are located downgradient of the interim removal action conducted in November 2003. The drop in concentration during the Fourth Quarter 2004 was believed to be a result of the interim remedial action. However, a rebound in arsenic and iron concentrations within these piezometers is currently occurring. Dissolved arsenic and iron concentrations will continue to be monitored downgradient of the interim removal action and new trends will be identified as they become apparent.

Potential changes to the groundwater flow patterns and any potential impact to contaminant migration will continue to be evaluated in future quarterly monitoring events.

Groundwater sampling frequency was reduced to annual within all Building 1065/1027 Area wells and piezometers, except 1065PZ1A, 1065PZ1B, 1065PZ2A, 1065PZ4A, 1065PZ5AR, 1065MW9A, 1065MW9B, 1065MW101, 1065MW102, and 1047MW101 until the Building 1065/1027 Area CAP is approved and implemented, at which time the groundwater monitoring program will be conducted in accordance with the CAP.

Table 6. Cleanup Levels for Groundwater
Building 1065 Area Corrective Action Plan
Presidio of San Francisco, California

Chemical [a]	Cleanup Level Outside of FEPZ/Ecological Buffer Zone (µg/L)	Cleanup Level Inside FEPZ/Ecological Buffer Zone (µg/L)	Source of Cleanup Level [b]
Total Petroleum Hydrocarbons (TPH)			
TPH as gasoline	770	443	Presidio-Wide Cleanup Level Document/TPH POC Concentrations
Metals / Inorganics			
Antimony	6	6	Presidio-Wide Cleanup Level Document
Arsenic	10	10	Basin Plan
Volatile Organic Compounds (VOCs)			
Benzene	1	1	Presidio-Wide Cleanup Level Document
Ethylbenzene	300	300	California MCL
Toluene	150	150	Presidio-Wide Cleanup Level Document
Xylenes	1,750	318	California MCL/Presidio-Wide Cleanup Level Document

µg/L	Micrograms per liter.
MCL	Maximum contaminant level.
--	Not available - where no level is listed, there are no Presidio cleanup levels or federal or California MCLs for the compound.

[a] Only identified groundwater COCs or PCOCs are listed.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
mg/L - milligrams per liter
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Cleanup levels taken from Table 6 of the Building 1065 Area CAP (MACTEC, 2005b). The MTBE cleanup level listed is equal to the California Maximum Contaminant Level (EKI, 2002). Total xylenes and TPHg have two different cleanup levels dependent on if the location is inside or outside of the Ecological Buffer Zone. In both cases, the higher cleanup level applies to wells outside of the Ecological Buffer Zone (e.g. the total xylenes cleanup level for wells outside of the Ecological Buffer Zone is 1,750 µg/L, whereas the cleanup level for wells inside the Ecological Buffer Zone is 318 µg/L). Piezometers 1065PZ7A, 1065PZ7B, 1065PZ4A, and 1065PZ4B are the only Building 1065 monitoring locations located inside the Ecological Buffer Zone.

3 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain of custody.
4 - Piezometers 1065PZ4A, 1065PZ4B, 1065PZ7A, and 1065PZ7B are located within the Ecological Buffer Zone and therefore, the lower cleanup level applies per the CAP.
-- Cleanup level not established
Bold numbers indicate concentrations that exceed cleanup levels.
µg/L - micrograms per liter
NA - Not analyzed
ND - Not detected
TPH - Total petroleum hydrocarbons
BTEX - Benzene, toluene, ethylbenzene, and total xylenes
MTBE - Methyl tert-butyl ether
H - Heavier hydrocarbons contributed to the quantitation.
L - Lighter hydrocarbons contributed to the quantitation.
Y - Sample exhibits a fuel pattern that does not resemble the standard.
Z - Sample exhibits unknown single peak or peaks.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - From Table 6 of the CAP (MACTEC, 2005b).
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed
-- Cleanup level not established
Bold concentrations indicate cleanup level exceedances.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historic data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Fourth Quarter 2004.
mg/L - milligrams per liter
TOC - Total Organic Carbon
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.
2 - The concentration of As V was determined by the laboratory by subtracting the As III concentration from the inorganic As concentration.
3 - Relative percentages of As III and As V were calculated by dividing the As III and As V concentrations by the As concentration and multiplying by 100.
4 - From Table 6 of the Building 1065 CAP (MACTEC, 2005a)
µg/L - micrograms per liter
-- Cleanup level not established
Bold concentrations indicate cleanup level exceedances.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - All depth to water measurements are an average of three measurements recorded in the field.
2 - Value represents the bottom of casing elevation in feet PLLW.
3 - Building 1027 wells are contoured with shallow Building 1065 wells.
4 - Groundwater level was at or above the top of casing. Value listed is top of casing elevation.
NM - Not measured
MW - Monitoring well
PZ - Piezometer
feet PLLW - feet above Presidio lower low water vertical datum

MINI-CAP AREAS
APPENDIX SECTION A-12
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Mini-Corrective Action Plans (Mini-CAP) document addresses, individually, the environmental concerns associated with USTs at 13 areas, including 12 buildings and one FDS area. Of the 13 sites listed in the *Mini-CAPs Site Reviews and Recommendations to Address Former Petroleum Release Sites* (Mini-CAP Report) prepared by Geo/Resource Consultants Inc. (GRC) in March 2004, only five are included in the Presidio-wide Groundwater Monitoring Program at the Presidio. The Mini-CAP Areas associated with the Presidio-wide Groundwater Monitoring Program include Buildings 514, 1221, 1213 and 1260 that formerly used USTs for fuel oil heating in residences and offices and gasoline fuel storage for services stations. Additionally, the Mini-CAP Areas also include one section of the former FDS pipelines associated with the Infantry Terrace/Sibert Residential loop (MT-14) (GRC, 2004). Each of the five Mini-CAP Areas included in the groundwater monitoring program are discussed in more detail below.

The five Mini-CAP Areas included in the Presidio-wide monitoring program have been divided into two areas (Area 1 and Area 2), based on location, in order to minimize the number of figures associated with this section and also to simplify the reporting. Mini-CAP Area 1 includes Building 1213, Building 1221, and Building 1260 and their locations and groundwater elevation contours are illustrated on Figures A-12-1 and A-12-2. Mini-CAP Area 2 includes Building 514 and FDS Section MT-14. The site plans, well locations, and groundwater elevation contours associated with Mini-CAP Area 2 are illustrated on Figures A-12-3 and A-12-4.

From 1993 until 1996, Montgomery Watson (MW) removed the USTs and associated piping from 15 buildings that historically used USTs. MW prepared the *Draft Mini-CAPs* in 1999 detailing subsurface investigation results at all 15 sites. In May 1999, International Technologies (IT) Corporation summarized FDS removal activities in the report titled *FDS Closure Report, Presidio of San Francisco, California* (FDS Closure Report). In this report, a CAP was recommended for FDS Sections MT-13 and MT-14. The portion of the FDS associated with MT-14 was subsequently incorporated into the Mini-CAP document.

In March 2003, the Trust requested review of the Mini-CAP and CAP reports completed by MW and IT Corporation by GRC. The Mini-CAP Report recommends additional site investigations and groundwater monitoring for Buildings 514, 1221, 1213, 1260, and the FDS Section MT-14 (GRC, 2004).

In August 2004, GRC installed 11 monitoring wells at the five Mini-CAP Areas. These wells were sampled by GRC for the first time in September 2005 (Third Quarter 2005), but were not added to the Presidio-wide Groundwater Monitoring Program until the Fourth Quarter 2005. Groundwater samples collected from the Mini-CAP wells in September 2005 were analyzed for TPHg, TPHd, TPHfo, VOCs, dissolved metals, PCBs and/or PAHs. The data associated with the September 2005 sampling event has been validated and the report is currently being prepared. This data will be presented in the next Semi-Annual Groundwater Monitoring Report. Groundwater samples collected from mini-CAP wells in the Fourth Quarter 2005 were analyzed for DO, TPHg, TPHd, TPHfo, BTEX, and MTBE (Table A-12-1).

Cleanup of the Mini-CAP Areas must adhere to Site Cleanup Requirements (SCRs) per *Order No. R2-2003-0080, Revised Site Cleanup Requirements and Recission of Order No. 91-082 and Order No. 96-070* (RWQCB, 2003). The SCRs are applicable soil and groundwater cleanup levels that protect human health, ecological receptors, and water quality.

1.1 Building 1213

Building 1213 is three story stucco house located in Mini-CAP Area 1 in the western upland portion of the Presidio on Ralston Avenue west of Battery-Howe Wagner (Figure A-12-1). The site elevation is approximately 222 feet above the PLLW datum.

Building 1213 reportedly contained an outdoor 500-gallon fuel oil UST that was removed in 1993. However, the presence of TPHg and benzene above the respective SCRs of 1,030 and 0.6 mg/kg in soil confirmation samples indicated that the UST was used for a gasoline generator. TPHg and benzene were detected in soil confirmation samples at concentrations of 1,500 and 2.8 mg/kg, respectively (GRC, 2004).

In 1999, MW drilled four soil borings 1213SB1 through 1213SB4. Groundwater was not sampled during this investigation. Soil borings, sample locations and chemical data tables, are documented in GRC's 2004 Mini-CAP Report. Soil samples from the borings were analyzed for TPHg, TPHd, BTEX, and VOCs. Of the compounds analyzed, TPHg, benzene, ethylbenzene, and total xylenes were detected at concentrations exceeding their applicable cleanup levels.

GRC installed one monitoring well (1213GW101) at Building 1213 as part of the Mini-CAP, which is currently included in the Presidio-wide Groundwater Monitoring Program.

1.2 Building 1221

Building 1221 is located in Mini-CAP Area 1 in the western upland portion of the Presidio within Fort Winfield Scott (Figure A-12-1) and lies at approximately 224 feet above the PLLW datum.

Four USTs (1221.1, 1221.2, 1221.3, and 1221.4) at Building 1221 were formerly associated with a gasoline service station. The three 6,000-gallon and one 10,000-gallon gasoline USTs were removed between June and September 1993. All the tanks reportedly contained gasoline; however, during removal activities the residual liquid in UST 1221.1 was a mixture of water and waste oil, indicating that the USTs may have been used for automotive waste oil storage.

A total of nine soil confirmation samples were collected from beneath the USTs and were analyzed for TPHg, TPHd, BTEX, and SVOCs. None of these compounds exceeded SCRs. It is unknown if soil was removed from the excavations (GRC, 2004).

In 1999, MW drilled eight exploratory soil and one grab groundwater boring adjacent to and within the former UST excavations. Soil samples were collected and analyzed for TPHg, TPHd, oil and grease, BTEX, and PAHs. PAHs were the only compounds detected above the SCRs. Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and benzo(k)fluoranthene were all detected at concentrations exceeding their applicable SCRs in soil. Two grab groundwater samples were collected from soil boring 1221HP2 at depths of 10 and 20 feet bgs. Groundwater samples were analyzed for TPHg, oil and grease, BTEX, and VOCs. Compounds detected included benzene, 1,2-DCE, PCE, TCE, and bis(2-ethylhexyl)pthalate. Bis(2-ethylhexyl)pthalate was the only compound detected that exceeded its applicable groundwater cleanup level of 4 µg/L. Detailed results are presented in the Mini-CAP Report (GRC, 2004).

Building 1221's Mini-CAP groundwater monitoring program includes four monitoring wells; 1221GW101, 1221GW102, 1221GW103, and 1221GW104 (Figure A-12-1).

1.3 Building 1260

Building 1260 is located in Mini-CAP Area 1 in the upland area of the Presidio in Fort Winfield Scott within the Special Status Ecological Cleanup Level area (Figure A-12-1). Schofield Avenue is west of the site and Veterans Boulevard (Highway 1) is to the east. The site elevation is approximately 142 feet PLLW (GRC, 2004).

Building 1260 formerly had a 10,000 gallon fuel oil UST that was used in conjunction with a fuel oil pump station. Both Building 1260 and the UST were removed from the site in 1993. Approximately 150 cubic yards of contaminated soil were removed during the removal (GRC, 2004).

There are three applicable soil SCRs for Building 1260: recreational human health SCRs, protection of groundwater quality SCRs (>5 feet above the highest groundwater), and Protection of Ecological Receptors SCRs (Table 7-5) (RWQCB, 2003).

Soil samples collected, as part of a subsequent subsurface investigation at the Building 1260 site, were analyzed for TPHd and BTEX compounds. TPHd was detected above the human health SCR of 1,380 mg/kg in two locations at concentrations of 3,100 and 2,300 mg/kg. TPHd was also detected above the ecological receptors SCR of 700 mg/kg at one location at a concentration

of 7,100 mg/kg. No other detected compounds were found to exceed applicable SCRs during this investigation.

The groundwater monitoring program at Building 1260 includes monitoring wells 1260GW101, 1260GW102, and 1260GW103 (Figure A-12-1).

1.4 Building 514

Building 514 is located in Mini-CAP Area 2 in the eastern upland portion of the Presidio at the southwest corner of Simonds Loop and Rawles Street (Figure A-12-3). Building 514 is approximately 200 feet above the PLLW datum.

In 1993, a 1,000 gallon fuel oil UST was removed from the site. Following the tank removal, approximately 30 cubic yards of soil were removed and sidewall confirmation samples were collected. Unknown TPH compounds were detected in one soil confirmation sample at a concentration of 3,800 mg/kg. No TPHd, BTEX and SVOCs were detected above laboratory reporting limits. During tank removal activities, no confirmation samples were collected from beneath the former UST; therefore, MW recommended a soil boring, grab groundwater boring and monitoring well be advanced to further characterize soil and groundwater at the site, but only soil borings were completed during this investigation (GRC, 2004).

In 1994, MW drilled three soil borings 514ASB1 through 514ASB3 to approximately 15 feet bgs. Soil samples were analyzed for TPHd, BTEX, and SVOCs. TPHd, BTEX and SVOCs were not detected above laboratory reporting limits in any of the soil borings.

The groundwater monitoring program for Building 514 includes one monitoring well, 514AGW101 (Figure A-12-3).

1.5 FDS Section MT-14 – Infantry Terrace/Sibert Loop

The Infantry Terrace/Sibert Loop FDS pipeline (Section MT-14) is located in Mini-CAP Area 2 and served residences on both sides of Sibert Loop, entering the area near Building 334, across Sibert Loop and running northeast through the Infantry Terrace area. The residences were served fuel oil through via lateral piping extending from a primary pipeline. IT removed or abandoned in place approximately 1,410 feet of FDS and lateral piping between October 1996 and February 1997. Of the 1,410 feet of piping approximately 699 feet were removed. Due to existing buildings and other features that prevented removal, approximately 711 feet of piping were abandoned in place (GRC, 2004).

During the pipeline removal, over excavation occurred between Buildings 333 and 334 (59 cubic yards) and also between Buildings 340 and 341 (1,667 cubic yards). The excavations were backfilled with soil treated in the Low Temperature Thermal Desorption (LTTD) unit.

Several confirmation samples collected during the removal action were found to exceed applicable SCRs for either TPH or PAHs. As a result, additional subsurface investigation and monitoring well installation was recommended (GRC, 2004).

The groundwater monitoring program for FDS MT-14 Area consists of two monitoring wells FM14EX07GW101 and FM14EX07GW102 (Figure A-12-3).

2.0 SITE DESCRIPTION AND GEOLOGY

Mini-CAP Areas currently included in the Presidio-wide Groundwater Monitoring Program are described below.

2.1 Building 1213

Building 1213 is situated in the Marina Groundwater Basin. Depth to groundwater was measured at approximately 29 feet bgs during the Fourth Quarter 2005 in monitoring well 1213GW101. Groundwater flow in this area follows the general topographic trend towards the east and northeast (Figure A-12-1).

Geology in the area is characterized by unconsolidated deposits consisting of Quaternary slope debris and ravine fill. The unconsolidated sediments are underlain by Franciscan complex bedrock. Based on cross sections by completed by MW in 1999, surface soils (less than 5 feet below grade) are characterized by clayey gravels and clayey sands. Serpentine bedrock is encountered beneath these materials at depths of approximately 23.5 feet (GRC, 2004).

2.2 Building 1221

Building 1221 is in the Marina Groundwater Basin (Figure 1). In the Fourth Quarter 2005, depth to groundwater ranged from 8.89 to 14.79 within monitoring wells 1221GW102 and 1221GW101, respectively. Groundwater flow follows the general topographic trend towards the east and northeast (Figure A-12-1).

Geology at the site is a combination of Quaternary slope debris, ravine fill and Franciscan complex bedrock. Serpentine bedrock from the Franciscan Formation is overlain by unconsolidated dune sand, clays and silty clay deposits (GRC, 2004).

2.3 Building 1260

Building 1260 is located in the West Valley Groundwater Area within the Marina Groundwater Basin. Depth to groundwater in the Fourth Quarter 2005 ranged between 17.35 and 29.49 feet bgs. Groundwater flow follows the general topographic trend towards the east (Figure A-12-1).

Geology at the Site consists of Franciscan Formation bedrock overlain by unconsolidated deposits of dune sands and clays. In borings completed by MW, clay was observed up to 14 feet bgs and was underlain by serpentine bedrock (GRC, 2004).

2.4 Building 514

Building 514 is located within an uplands area of the Marina Groundwater Basin (Figure 1). In the Fourth Quarter 2005, the depth to groundwater was measured at 21.46 feet bgs. Groundwater flow follows the general topographic trend towards the west and northwest (Figure A-12-3).

Geology at the site consists of the Franciscan complex bedrock to depths of approximately 16 feet bgs overlain by unconsolidated clays and silts (GRC, 2004).

2.5 FDS Section MT-14

FDS Section MT-14 is located in the Marina Groundwater Basin (Figure 1). In the Fourth Quarter 2005, the depth to groundwater was measured at approximately 26 to 28 feet bgs. Groundwater flow follows the general topographic trend towards the east (Figure A-12-3).

Geology at the site consists of the Franciscan complex bedrock, consisting primarily of sandstone, overlain by undifferentiated slope debris. The surface deposits overlie the bedrock at depths ranging from 1.5 to 17 feet bgs (GRC, 2004).

3.0 GROUNDWATER MONITORING

The Mini-CAP Areas have 11 associated monitoring wells (Figures A-12-1 and A-12-3). Groundwater elevations were collected at all 11 wells in the First and Second Quarters 2006. All of the Mini-CAP monitoring wells were sampled in accordance with Tables 1A and 1B during the First and Second Quarters 2006, respectively.

Water level meters were calibrated on 6 March and 22 May 2006 for the First and Second Quarters 2006, respectively. The calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

3.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were manually collected on 6 March and 22 May 2006 at all Mini-CAP monitoring wells for both the First and Second Quarters 2006 and are summarized in Table A-12-4. Mini-CAP wells are located in two separate areas at the Presidio, and groundwater elevation maps are presented as Mini-CAP Area 1 (Figures A-12-1 and A-12-2) and Mini-Cap Area 2 (Figures A-12-3 and A-12-4).

In Mini-CAP Area 1, groundwater elevations during the First Quarter 2006 ranged from 120.74 to 216.66 feet above PLLW in monitoring wells 1260GW103 and 1221GW102, respectively (Figure A-12-2). Mini-CAP Area 2 groundwater elevations during the First Quarter 2006 ranged from 149.18 to 181.11 feet above PLLW in monitoring wells FM14EX07GW102 and 514AGW101, respectively (Figure A-12-4).

Second Quarter 2006 groundwater elevations in Mini-CAP Area 1 ranged from 124.25 to 216.67 feet above PLLW in monitoring wells 1260GW103 and 1221GW101, respectively (Figure A-12-2). Mini-CAP Area 2 groundwater elevations during the Second Quarter 2006 ranged from 148.69 to 181.25 feet above PLLW in monitoring wells FM14EX07GW102 and 514AGW101, respectively (Figure A-12-4).

Groundwater gradients were calculated for both the northerly and southerly portions of Mini-CAP Area 1 in order to better understand groundwater flow directions. Data from monitoring wells 1213GW101 and BHWGW01 were used for the northern portion and data from monitoring wells 1221GW101 and 1260 GW103 were used for the southern portion of Mini-CAP Area 1. Groundwater gradients in Mini-CAP Area 2 were calculated for the eastern and western portion of the area by using data from monitoring wells FM14EX07GW102, TH-4 and 514AGW101. Groundwater elevation data for study areas adjacent to Mini-CAP Areas 1 and 2 can be found in Tables A-4-3, A-7-5 and A-6-5, respectively.

Mini-CAP Area 1 groundwater flow directions were northeasterly in the northern portion of the area and easterly in the southern portion of the area, during the First and Second Quarters 2006 (Figures A-12-1 and A-12-2). During the First Quarter 2006, the groundwater gradient in the northern portion of Mini-CAP Area 1 was approximately 0.05 feet per foot. The groundwater gradient in the southern portion of Mini-CAP Area 1 was approximately 0.10 feet per foot.

During the Second Quarter 2006, the groundwater gradient in the northern portion of Mini-CAP Area 1 was approximately 0.06 feet per foot and the groundwater gradient in the southern portion was 0.10 feet per foot.

Mini-CAP Area 2 groundwater flow direction for both the First and Second Quarters 2006 was generally from the higher elevations of Landfill E, Landfill 2, Fill Site 1 and Building 514, northerly, towards the lower elevation of Tennessee Hollow. During the First Quarter 2006, the groundwater gradient between monitoring wells FM14EX07GW102 and TH-4 was calculated to be approximately 0.06 feet per foot. The groundwater gradient between monitoring wells TH-4 and 514AGW101 was approximately 0.08 feet per foot. Groundwater gradients in Mini-CAP Area 2 during the Second Quarter 2006 were similar to those observed during the First Quarter.

3.2 Monitoring Well Purging and Sampling

In the First Quarter 2006, all 11 Mini-CAP monitoring wells were sampled and in the Second Quarter 2006, five Mini-CAP monitoring wells were sampled. All Mini-CAP wells were

sampled using methods shown in Tables 1A and 1B and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a). In addition to the primary samples collected during the First Quarter 2006, a duplicate sample (DUP0317062A) was collected from 1213GW101. During the Second Quarter 2006, duplicate (DUP05242006) and QC duplicate (1213GW101CL) samples were collected from 1213GW101.

Purge equipment, purging volumes, purge water parameters, and sampling equipment for each monitoring well are described in the purge records at the conclusion of this subsection. Purge water was stored, for future disposal, in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

3.3 Groundwater Analytical Program

First Quarter 2006, groundwater samples were collected from all 11 monitoring wells on 6 March 2006 and analyzed for TPHg, TPHd, TPHfo, BTEX, MTBE and PAHs. A groundwater sample from one well (1213GW101) also was analyzed for VOCs. Second Quarter 2006 groundwater samples were collected from five monitoring wells on 22 May 2006. Four of the groundwater samples were analyzed for dissolved oxygen, BTEX, MTBE, PAHs, TPHg, TPHd and TPHfo; two of the groundwater samples were analyzed for general chemistry parameters and dissolved metals. One groundwater sample, from well 1213GW101, was analyzed for VOCs. VOC analysis in this well will continue on a quarterly basis.

All groundwater samples collected during both the First and Second Quarters 2006, were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main report discusses the QA/QC sampling and analysis performed during the First and Second Quarters 2006.

4.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater analytical results are presented in Tables A-12-1 through A-12-3 and are discussed below.

4.1 Dissolved Oxygen

Dissolved oxygen results for the First and Second Quarters 2006, are presented in Table A-12-1.

During the First Quarter 2006, the concentrations of dissolved oxygen within the Mini-CAP Area monitoring wells ranged from 0.12 mg/L (1260GW102) to 0.87 mg/L (FM14EX07GW102)

During the Second Quarter 2006, dissolved oxygen concentrations ranged from 0.36 mg/L (1213GW101) to 0.58 mg/L (FM14EX07GW102).

4.2 TPH Results

During the First Quarter 2006, all Mini-CAP monitoring wells were analyzed for TPHg, TPHd, and TPHfo. During the Second Quarter 2006, five Mini-CAP Area monitoring wells were analyzed for TPHg, TPHg and TPHfo. The results of the TPH analyses are included in Table A-12-1 and detected results are discussed below. Cleanup levels presented in Table 7-6 of the Cleanup Levels Document have been added to Table A-12-1 for comparison purposes.

During the First Quarter 2006, TPHg was detected at concentrations of 87 and 230 within monitoring wells 1213GW101 and 1221GW102, respectively. During the Second Quarter 2006 TPHg was detected within monitoring well 1213GW101 at a concentration of 68 µg/L. TPHg was not detected within any other groundwater samples during the First Quarter 2006.

During First Quarter 2006, TPHd was detected at concentrations of 61, 53 and 88 µg/L within monitoring wells 1213GW101, 1221GW101 and 1260GW102, respectively. TPHd was not detected within any monitoring wells during the Second Quarter 2006.

TPHfo was not detected above laboratory reporting limits in any of the Mini-CAP groundwater samples collected during the First or Second Quarters 2006.

The detections of TPHg and TPHd were well below the Mini-CAP Area cleanup levels of 770 and 880 µg/L, respectively.

4.3 BTEX and MTBE Results

In the First Quarters 2006, all samples were analyzed for BTEX and MTBE. During the Second Quarter 2006, four samples were analyzed for BTEX and MTBE. The BTEX and MTBE results are presented in Table A-12-1.

During the First Quarter 2006, benzene was detected only in monitoring well 1213GW101 at a concentration of 1.5 µg/L. Toluene, ethylbenzene and total xylenes were not detected above laboratory reporting limits in monitoring well 1213GW101.

During the Second Quarter 2006, benzene was detected only in monitoring well 1213GW101, at a concentration of 8.5 µg/L. Benzene was also detected in the duplicate and QC samples collected from 1213GW101, at concentrations of 34 and 11 µg/L, respectively. The duplicate concentration is more than an order of magnitude greater than the previous high detection within this well. The RPD between the primary and duplicate samples exceeds the QAPP-specified 50% criteria, as described in the First Quarter 2006 DataVal report presented in Appendix D.

During the First Quarter 2006, MTBE was detected in samples from monitoring wells 514AGW101 and FM14EX07GW102, at concentrations of 3.6 and 2.3 µg/L, respectively. These concentrations do not exceed the cleanup level for MTBE (13 µg/L). MTBE was not detected above laboratory reporting limits in any of the samples analyzed during the Second Quarter 2006.

During the First and Second Quarters 2006, 1,2-Dichloroethane was detected only in the 1213GW101 samples at 5.8 to 8.9 µg/L and 6.6 to 9.6 µg/L, respectively, well above the 0.5 µg/L cleanup level.

Cleanup levels presented in Table 7-6 of the Cleanup Levels Document have been added to Table A-12-1 for comparison purposes. Benzene and 1,2-dichloroethane were the only compounds detected above their associated cleanup levels (1 and 0.5 µg/L, respectively) within 1213GW101. BTEX, MTBE, and VOCs will continue to be monitored within Mini-CAP monitoring wells.

4.4 PAH Results

All First Quarter 2006 samples were analyzed for PAHs (Table A-12-2). Only fluoranthene was detected in the 514AGW101 and FM14EX07GW102 samples at 0.12 and 0.09 µg/. These concentrations were estimated and below the laboratory reporting limits.

4.5 Dissolved Metal Results

During the First Quarter 2006, no Mini-CAP Area monitoring wells were analyzed for dissolved metals.

During the Second Quarter 2006, 1213GW101 and 1221GW104 were analyzed for 23 dissolved metals. Chromium was detected in the primary sample from monitoring well 1213GW101 at a concentration of 54 µg/L, which exceeds the cleanup level of 50 µg/L.

Monitoring well 1213GW101 is screened in serpentinite. Based on the *Technical Memorandum Regarding the Hexavalent Chromium in Serpentinite Bedrock and Groundwater in Upland Areas* (Montgomery Watson, 1999o) and the *Memorandum Regarding the Natural Occurrence of Hexavalent Chromium in Surface Water and Groundwater at the Presidio of San Francisco, California* (EKI, 2000c), hexavalent chromium and dissolved chromium in groundwater in upland areas of the Presidio appear to be naturally occurring and derived from serpentinite. There is no known anthropogenic chromium source associated with Building 1213. Thus, dissolved chromium appears to be naturally occurring at Building 1213.

Due to the small number of sampling events, there are not yet apparent trends in dissolved metals concentrations within the Mini-CAP Area monitoring wells. Dissolved metals results are presented in Table A-12-3.

5.0 CONCLUSIONS & RECOMMENDATIONS

Groundwater cleanup levels for benzene, 1,2-dichloroethane and chromium were exceeded on five occasions, all from groundwater sample concentrations collected from monitoring well 1213GW101. In both the First and Second Quarters 2006, benzene was detected in monitoring well 1213GW101 at concentrations of 1.5 and 8.5 µg/L, respectively. These concentrations exceed the groundwater cleanup level of 1 µg/L. The groundwater cleanup level also was exceeded during the First and Second Quarters 2006 for 1,2-DCA, which was detected at concentrations of 5.8 to 8.9 and 6.6 to 9.6 µg/L, respectively, in the primary and duplicate samples from monitoring well 1213GW101.

During the First Quarter 2006, TPHg was detected below the 770 µg/L cleanup level within 1213GW101 and 1221GW102 at 230 and 87 µg/L, respectively. The concentration of TPHg decreased to 68 µg/L in monitoring well 1213GW101 during the Second Quarter 2006. During the First Quarter 2006, TPHd was detected below the 880 µg/L cleanup level within monitoring wells 1213GW101, 1221GW102 and 1260GW102, at concentrations of 61, 53, and 88 µg/L, respectively. The TPHd concentration in monitoring well 1213GW101 decreased from 61 µg/L to <50 µg/L during the Second Quarter 2006. MTBE was detected below the 13 µg/L cleanup level during the First Quarter 2006 in monitoring wells 514AGW101 and FM14EX07GW102, at concentrations of 3.6 and 2.3 µg/L, respectively.

During the Second Quarter 2006, chromium was detected in the primary sample from monitoring well 1213GW101 at a concentration of 54 µg/L, which exceeds the cleanup level of 50 µg/L.

TPH, BTEX, MTBE, VOCs, and dissolved metals analysis will be conducted during future sampling events to develop a baseline of data and evaluate concentration trends for the Mini-CAP Area monitoring wells.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Cleanup levels taken from Table 7-6 in the *Development of Presidio-wide Cleanup Levels for Soil, Sediment, Groundwater, and Surface Water* (EKI, 2002).
-- Cleanup level not established
Bold numbers indicate concentrations that exceed cleanup levels.
mg/L - milligrams per liter
µg/L - micrograms per liter
TPH - Total petroleum hydrocarbons
MTBE - Methyl tert-butyl ether
1,2-DCA - 1,2-Dichloroethane
VOCs - volatile organic compounds
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
NA - Not analyzed
NM - Not measured

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.
The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Cleanup levels taken from Table 7-6 in the *Development of Presidio-wide Cleanup Levels for Soil, Sediment, Groundwater, and Surface Water* (EKI, 2002).
-- Cleanup level not established
Bold numbers indicate concentrations that exceed cleanup levels.
µg/L - micrograms per liter
Table 7 in the main report identifies all duplicate and split samples and the well from
Table 11 in the main report identifies current and historical data qualifiers.

Notes:
Groundwater elevation data collected on 6 March 2006.

Groundwater elevations for UBR02GW01 and UBR03GW01 were not used in groundwater contouring.

300GW01 was approved for removal from the groundwater monitoring program prior to the First Quarter 2006.

Landfill E wells DAEGW06 and DAEGW07 were not contoured, due to semi-confined and perched conditions, respectively. Whereas, well DAEGW101 was not contoured because it is screened in a deeper interval.

NIKE MISSILE FACILITY
APPENDIX SECTION A-13
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Nike Missile Facility is located in the southwest portion of the Presidio (Figure 1) and consists of two terraced areas: the Building 1450/1451 area and the Silo/Magazine area (Dames & Moore, 1997). The Building 1450/1451 area is located on the northern, upland portion of the site. The Silo/Magazine area consists of three abandoned underground missile silos located southeast and downhill from the Building 1450/1451 area. Silo/Magazine #1 is on the middle terrace, and Silo/Magazines #2 and #3 are south of Silo/Magazine #1 (Figure A-13-1).

The Nike Missile Facility opened in 1956 and was taken out of service in 1965. Building 1450 functioned as the missile-launch room, the missile-battery maintenance area, an administration office, and living quarters. Building 1451 was used as an operational support and maintenance facility for the Nike Missile Facility. Hydraulic oil, hydraulic oil storage tanks, hydraulic oil equipment, standing water, and debris (including damaged asbestos-containing material, deteriorated lead-based paint, hydrocarbon-affected soil, sludge, and miscellaneous debris) associated with the three missile silos were removed by the International Technology Corporation (IT) between December 1998 and February 1999. In addition to the removal of these hazardous materials, all mechanisms left in place within the silo/magazines were power-washed. The recovered materials and debris were classified and appropriately disposed (IT, 1999).

Since September 1992, monitoring wells at the Nike Missile Facility site have been analyzed for TPH, PAHs, cyanide, VOCs, and dissolved metals. Analytical results summaries are presented in Tables A-13-1 through A-13-4.

During the First Quarter 2004, perchlorate and N-nitrosodimethylamine (NDMA) analyses were performed within all Nike Missile Facility monitoring wells as part of the Trust's Emergent Chemical Study, requested by the RWQCB. The results of the Emergent Chemical Study were detailed in the *Draft Technical Report: Emergent Chemical Study, First Quarter 2004* (Treadwell & Rollo, 2004b) and are briefly summarized in Section 3.0 below.

2.0 SITE DESCRIPTION AND GEOLOGY

The Nike Missile Facility is located in the Lobos Creek Groundwater Basin (Figure 1). Groundwater at the site is generally present between 10 and 40 feet bgs. Groundwater flow at the Nike Missile Facility is reported to follow the general topographic trend towards the south-southeast (Montgomery Watson, 1997a).

Soils beneath the Nike Missile Facility consist of engineered fill, dune sand, fine-grained deposits of the Colma Formation, and Franciscan Complex bedrock. Engineered fill was imported and graded for construction in the 1950s. Engineered fill is present at the surface and to depths ranging from 10 to 24.5 feet bgs. Beneath the fill, either dune sand or the Colma Formation is present to depths of 20 feet bgs in the northern portion of the site and 42 feet in the south. The Colma Formation is underlain by serpentinite bedrock (Montgomery Watson, 1997a).

3.0 EMERGENT CHEMICAL STUDY

The Trust, at the request of the RWQCB, identified potential source areas for emergent chemical releases and developed a groundwater monitoring plan to address potential source areas at the Presidio. The sampling program was requested by the RWQCB in a letter to the Trust dated 23 June 2003. The emergent chemical groundwater sampling program was developed to determine if past uses at the Presidio resulted in groundwater contamination associated with emergent chemicals identified as perchlorate, NDMA, 1,4-dioxane, 1,2,3-trichloropropane (TCP), hexavalent chromium, and polybrominated diphenyl ether (PBDE).

The Trust transmitted the results of their source area evaluation in a letter to the RWQCB, entitled *Preliminary Evaluation of Potential Emergent Chemical Use Areas and Locations at the Presidio of San Francisco (*Source Evaluation Report), dated 25 November 2003. The potential emergent chemical source areas were evaluated by the Trust considering the following information: 1) the existing environmental data currently contained within the Trust's database; 2) the potential for an emergent chemical or a material containing an emergent chemical to have been used and released in a significant quantity at the Presidio; and, 3) locations of sensitive groundwater use areas at the Presidio (Trust, 2003).

Based on the Source Evaluation Report, a follow up groundwater monitoring program concerning potential releases of emergent chemicals at the Presidio was implemented during the First Quarter 2004. NDMA was the only emergent chemical detected above laboratory detection limits during the First Quarter 2004. 1,4-dioxane, perchlorate, and PBDE were not detected above laboratory detection limits within any samples analyzed during the First Quarter 2004 (Treadwell & Rollo, 2004b).

NDMA is a decomposition product of Aerozine 50, a component used in the production of rocket fuel. NDMA has contaminated surface and groundwater at missile and other rocket fuel sites.

NDMA has also been formed through other industrial processes, such as the chlorination of drinking water and the treatment of sewage for wastewater recycling. NDMA is considered by health experts to be a carcinogen (RWQCB, 2003).

The following remedial goals and action levels for NDMA have been established.

- The EPA's Preliminary Remedial Goal (PRG) for tap water is 0.0013 µg/L.
- The California Department of Health Services (CDHS) notification level (formerly action level) for NDMA is 0.01 µg/L.

The Source Evaluation Report identifies the Nike Missile Facility and former Army explosive testing areas as potential NDMA source areas. All Nike Missile Facility monitoring wells had samples collected and analyzed for NDMA during the First Quarter 2004. The discussion below relates to the NDMA sampling which took place during the First Quarter 2004 at the Nike Missile Facility.

Groundwater samples collected from monitoring wells NKGW01 through NKGW05 were analyzed for NDMA by EPA Method 1625 during the First Quarter 2004. NDMA analysis was also completed on the duplicate sample (DUP0317042A) collected from NKGW01.

In 2004, NDMA was detected at concentrations of 0.0048, 0.0016J, 0.0025, and 0.0009J µg/L within NKGW01, DUP0317042A, NKGW04 and NKGW05, respectively. The detected concentrations below the practical quantitation limit of 0.002 µg/L and above the method detection limit of 0.0005 µg/L were estimated and therefore qualified with a 'J'. The Relative Percent Difference (RPD) between the primary and the duplicate samples collected from NKGW01 exceeds the 50% criteria specified in the *Presidio-wide Quality Assurance Project Plan Sampling and Analysis Plan* (QAPP) (Tetra Tech, 2001). However, the data was considered usable and did not require qualification by DataVal, as described in the First Quarter 2004 DataVal report. NDMA was not detected in NKGW02 or NKGW03 samples above laboratory detection limits during the First Quarter 2004. Detection limits and detected concentrations were well below the CDHS action level of 0.01 µg/L. However, the detected concentrations of NDMA within NKGW01 and NKGW04 in the First Quarter 2004 exceeded the EPA's Region 9 Tap Water PRG (0.0013 µg/L).

NDMA was sampled within all Nike Missile Facility monitoring wells during the Third Quarter 2004 and will continue to be sampled within all Nike Missile Facility monitoring wells during the first and third quarters to establish a baseline of data. A *Remedial Action Plan* (RAP) is currently being prepared for the Nike Missile Facility and a revised groundwater monitoring plan will be implemented at the Nike Missile Facility, in accordance with the RAP when it is approved by the RWQCB and other stakeholders (Treadwell & Rollo, 2004b).

4.0 GROUNDWATER MONITORING

The Nike Missile Facility has five associated monitoring wells (Figure A-13-1). Groundwater elevations were collected at all site wells during the First Quarter 2006 and four of the five site wells in the Second Quarter 2006. Groundwater samples were collected at all Nike Missile Facility monitoring wells during the First Quarter 2006 and analyzed for MTBE, VOCs, cyanide, dissolved oxygen, NDMA, TPHg, TPHd, TPHfo, and 23 dissolved metals, in accordance with the proposed sampling schedule (Table 1A). No groundwater samples were scheduled for collection during the Second Quarter 2006, in accordance with the proposed sampling schedule (Table 1B).

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 06 March and 22 May 2006. Groundwater elevations are presented in Table A-13-5. Groundwater elevation maps showing groundwater contours and flow directions for the Nike Missile Facility are included as Figures A-13-1 and A-13-2. Water level meter calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

Groundwater elevations at the Nike Missile Facility during the First Quarter 2006 ranged from 251.58 to 320.75 feet above PLLW in monitoring wells NKGW01 and NKGW03, respectively (Figure A-13-1). Groundwater elevations at the Nike Missile Facility during the Second Quarter 2006 ranged from 252.17 to 320.70 feet above PLLW in monitoring wells NKGW01 and NKGW03, respectively (Figure A-13-2). The groundwater elevations are consistent with historical elevations measured at the site.

During the First and Second Quarters 2006, groundwater flow was in a south-southeasterly direction following the general topographic trend. The groundwater gradient was estimated to be approximately 0.10 feet per foot during both the First and Second Quarters 2006.

4.2 Monitoring Well Purging and Sampling

During the First Quarter 2006, all Nike Missile Facility monitoring wells were purged and sampled on either 10 or 20 March 2006, in accordance with methods shown in Table 1A and procedures described in the FSP (Treadwell & Rollo, 2001a). In addition to the primary samples collected during the First Quarter 2006, a duplicate sample (DUP0320061A) also was collected from monitoring well NKGW04. No Nike Missile Facility monitoring wells were proposed for sampling during the Second Quarter 2006.

Purging equipment, purging volumes, purge water parameters, and sampling equipment for each monitoring well are described in the purge records at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed for the First and Second Quarters 2005.

5.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected from Nike Missile Facility monitoring wells during the First Quarter 2006 were analyzed for dissolved oxygen, cyanide, MTBE, VOCs, cyanide, dissolved oxygen, NDMA, TPHg, TPHd, TPHfo, and 23 dissolved metals. The TPHfo standard currently being used is a TPHmo standard, as defined by the Presidio QAPP, with a carbon range of C_{24} to C_{36}. Section 5.4.3.1 in the main report discusses the data compatibility issues associated with TPH analyses.

The following sections discuss detected analytes.

5.1 Dissolved Oxygen and Cyanide Results

Dissolved oxygen and cyanide concentrations are presented in Table A-13-1. During the First Quarter 2006, dissolved oxygen concentrations within Nike Missile Facility monitoring wells ranged from 0.91 mg/L to 5.95 mg/L at NKGW01 and NKGW02, respectively. These concentrations were within historical ranges.

Cyanide was detected at a new high concentration of 0.01 mg/L within monitoring well NKGW05, during the First Quarter 2006. This concentration equals the laboratory reporting limit of <0.01 mg/L and is significantly lower than the drinking water cleanup level of 200 mg/L for cyanide, as listed in the Cleanup Levels Document (EKI, 2002). Cyanide has only been detected at NKGW05 and only once previously at 0.00628 µg/L in 1995.

5.2 NDMA

All Nike Missile Facility groundwater samples collected were analyzed for NDMA during the First Quarter 2006. NDMA results are presented in Table A-13-1. NDMA was detected in three of the five groundwater samples collected from Nike Missile Facility monitoring wells at concentrations ranging from 0.003 to 0.0019 µg/L in the primary and duplicate samples collected from monitoring well NKGW04 to 0.0045 µg/L in the sample collected from monitoring well NKGW01. NDMA was not detected above laboratory reporting limits in monitoring wells NKGW02 and NKGW03. All detected concentrations of NDMA exceed the EPA's Preliminary

Remedial Goal (PRG) for tap water of 0.0013 µg/L, but none of the detected results exceed the CDHS action level of 0.01 µg/L.

5.3 TPH

All Nike Missile Facility groundwater samples collected were analyzed for TPHg, TPHd, and TPHfo during the First Quarter 2006. TPH was not detected in any of the samples collected from the site during the First Quarter 2006. TPH results are presented in Table A-13-2. TPH was last detected at the Nike Missile Facility at monitoring well NKGW01 in the First Quarter 1999 (TPHd at 65 mg/L).

5.4 VOC and MTBE Results

All Nike Missile Facility groundwater samples collected were analyzed for VOCs and MTBE during the First Quarter 2006. No VOCs or MTBE were detected in any of the samples collected within Nike Missile Facility monitoring well samples during the First Quarter 2006 or in the First Quarters of 2004 and 2005. VOCs and MTBE analytical results are presented in Table A-13-3. MTBE has never been detected in groundwater at this site. Only benzene and toluene have been detected but sporadically and at low concentrations and were last detected in the First Quarter 2003.

5.5 Dissolved Metals

All Nike Missile Facility groundwater samples collected were analyzed for dissolved metals during the First Quarter 2006. Dissolved metals results are presented in Table A-13-4.

The table below summarizes new high and low dissolved metal results for the First Quarter 2006 when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and on the number of duplicated analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
NKGW01	Nickel	17 / 17	49	96.5	39	--	µg/L
NKGW02	Total Dissolved Solids	6 / 6	220	320	--	330	mg/L
NKGW03	Potassium	2 / 7	<500	620	--	1,000	µg/L
NKGW04	Cadmium	4 / 14	< 0.5	2.3	--	18	µg/L
	Copper	7 / 14	<1	2.2	--	2.6	µg/L
	Magnesium	14 / 14	26,000	47,200	21,000	--	µg/L
	Potassium	7 / 14	<5,000	980	--	1,500	µg/L
	Sodium	14 / 14	33,000	52,000 *	23,000	--	µg/L
	Total Dissolved Solids	7 / 7	240	360	--	760	mg/L

Location	Analyte	Detects / Samples	Historical Data		New High/Low First Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
NKGW04	Zinc	6 / 14	< 20	220	--	950	µg/L
NKGW05	Cadmium	2 / 14	< 0.5	1.1	--	1.6	µg/L
	Total Dissolved Solids	6 / 6	320	430	--	1,030	mg/L

Qualified data in the table above is indicated with an asterisk (*).

The majority of the metals concentrations measured during the First Quarter 2006 are within historical ranges. Significant new high and low dissolved and total metals results are discussed below.

- During the First Quarter 2006, dissolved cadmium was detected at a new high concentration of 18 µg/L within monitoring well NKGW04. This concentration is nearly seven times the previous high concentration for this well.

- Dissolved zinc was detected at new high concentrations of 860 to 950 µg/L within the primary and duplicate samples from monitoring well NKGW04 which are approximately four times higher than the previous high concentrations.

The remaining new high and low concentrations from the First Quarter 2006 can be attributed to natural fluctuations and are not considered significant.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions during the First and Second Quarters 2006 are consistent with historical values and interpretations. NDMA was detected above laboratory limits within three of the five Nike Missile Facility monitoring wells sampled during the First Quarter 2006. All detected concentrations of NDMA exceed the EPA's Preliminary Remedial Goal (PRG) for tap water of 0.0013 µg/L, but none of the detected results exceed the CDHS notification level of 0.01 µg/L.

NDMA will continue to be sampled within all Nike Missile Facility monitoring wells during the first and third quarter sampling events to establish a baseline of data. The addition of field QC blanks for NDMA will be added to this program in the First Quarter 2007 in order to comply with the QAPP and guard against unknown field contamination of the sample. A RAP is currently being prepared for the Nike Missile Facility and a revised groundwater monitoring plan will be implemented, in accordance with the RAP, when it is approved by the DTSC, RWQCB, and other stakeholders. There are no other proposed changes to the groundwater monitoring program at this site.

Notes
1 - The identified analytical method is for samples performed beginning the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed
NM - Not measured
NS - Not sampled
NDMA - N-nitrosodimethylamine
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.
The analytical methods used during previous quarters are identified in the respective quarterly reports.
µg/L - micrograms per liter
NA - Not analyzed
ND - Not detected
VOCs - Volatile organic compounds
MTBE - Methyl tert-butyl ether
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Table A-13-5
Groundwater Elevation Summary
Nike Missile Facility
Presidio of San Francisco, California

Notes
1 - All depth to water measurements are an average of three measurements recorded in the field.
2 - NKGW01 and NKGW05 were not located during the water level survey. Both wells were measured during sampling on 1 September 2005.
3 - Value represents the bottom of casing elevation in feet PLLW.
4 - Monitoring well was not located during the water level survey.
5 - NKGW01 was not located during the water level survey on 8 May 2001. The groundwater elevation was measured on 17 May 2001.

MW - Monitoring well
NM - Not measured
feet PLLW - feet above Presidio Lower Low Water vertical datum

FIGURE A-13-2

BAKER BEACH DISTURBED AREA 3
APPENDIX SECTION A-14
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Baker Beach Disturbed Area 3 (BBDA 3) is located along the western edge of the Presidio within the ravine south of Battery Crosby (Figure 1). The site is bordered on the west by the Pacific Ocean and on the east by Lincoln Boulevard. Battery Crosby is north of the site, and the access road for the battery off Lincoln Boulevard bisects the site (Figure A-14-1). The site elevation ranges from approximately 50 to 250 feet above PLLW.

Based on a review of aerial photographs, BBDA 3 received fill material intermittently between 1948 and 1973. Fill material was initially placed in BBDA 3 for erosion control along Lincoln Boulevard and along the access road to Battery Crosby (Figure A-14-1). This area was used for additional dumping of debris until approximately 1973 (Treadwell & Rollo, 2004a).

On 6 February 2004, two temporary piezometers were installed and developed using surge and purge methods in general accordance with the FSP (Treadwell & Rollo, 2001a). At the time of the installation, the piezometers were identified as BB3PZ1A and BB3PZ1B. Subsequently, the piezometers were designated as BB3PZ100A and BB3PZ100B to adhere to QAPP naming conventions.

On 22 June 2004, both BBDA 3 temporary piezometers were abandoned following the Second Quarter 2004 sampling and prior to commencement of remedial construction activities described below in Section 3.0. BBDA 3 excavation activities were conducted between July and December 2004. Following the excavation activities, two monitoring wells, one piezometer and three fixed surface water sampling points were installed and quarterly groundwater monitoring began. An additional fixed surface water monitoring point, BB3SW104, and piezometer, BB3PZ102, were installed in the First Quarter 2006 as requested by DTSC.

2.0 SITE DESCRIPTION AND GEOLOGY

BBDA 3 is located near the southern boundary of the Coastal Groundwater Basin (Figure 1). Based upon hydrogeologic information from adjacent areas, groundwater may be present in limited areas of the landslide deposits, dune sands, and the weathered serpentinite bedrock formations. Groundwater has been encountered within the BBDA 3 footprint in the eastern portion of the site at depths of 18 to 29 feet bgs (Treadwell & Rollo, 2003c). Groundwater flow

is assumed to follow the general topographic trend to the west toward the Pacific Ocean (Figures A-14-1 and A-14-2).

Battery Crosby is north of the site, and, prior to remedial activities, the access road for the battery off Lincoln Boulevard bisected the site (Figure A-14-1) (Treadwell & Rollo, 2005a). The fill material in BBDA 3 was composed primarily of soil and debris fill containing concrete, asphalt, and metal debris. Buttress fill material, consisting mainly of sand (fill sand) was initially placed in BBDA 3 along Lincoln Boulevard and along the access road to Battery Crosby. This area was used for additional dumping of debris (waste fill) until approximately 1973 (Dames & Moore, 1997).

The area in the vicinity of BBDA 3 is a steeply sloping bluff with a narrow beach (Baker Beach) at its base. Surface drainage in the area is to the west, toward the Pacific Ocean. Vegetation in the area consists of grasses, shrubs, and trees.

BBDA 3 lies at the boundary of two geologic regimes. The northern portion is predominantly Franciscan Formation overlain by landslide deposits, which generally consist of unstratified mixtures of bedrock fragments, sand, silt, and clay. The southern portion is covered almost entirely by Quaternary dune sand (Schlocker, 1974).

Prior to the remedial activities, an ephemeral seep, BB3SP01, flowed at the bottom of the ravine below BBDA 3 (Figure A-14-1). All historical surface water monitoring data for BBDA 3 are presented in the RAP. In May 2000, the Trust collected water samples from the shallow subsurface of the area and analyzed the samples for inorganics, TPHg, TPHd, VOCs, OCPs, PCBs, and chlorinated herbicides. One of the seep samples was found to contain TPHd at 77 µg/L (EKI, 2000).

At the request of DTSC, the Trust performed a slope stability analysis at BBDA 3 to determine whether excavation of the waste fill material at the site might undermine the structural fill buttress supporting Lincoln Boulevard east of Battery Crosby Road. The findings of this investigation are documented in the *Slope Stability Evaluation Report, Baker Beach Disturbed Area 3* (Treadwell & Rollo, 2004d). As recommended in that report, the stability of the slope supporting Lincoln Boulevard was monitored during excavation of waste materials at BBDA 3.

A pair of temporary piezometers were installed and monitored as part of the slope stability evaluation. Groundwater was found to be present in the dune sands and weathered serpentinite bedrock formations (Treadwell & Rollo, 2004d). Surface water drainage and groundwater flow appears to follow the general topographic trend, to the west and toward the Pacific Ocean. As documented in the RAP, it was anticipated that removal of the fill material could alter the location(s) of the freshwater seep(s) located at the western boundary of BBDA 3.

3.0 REMEDIAL ACTION PLAN

The *Remedial Action Plan* (RAP) *for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4*, selected excavation, recycling, and offsite disposal of impacted fill material and underlying soil, along with groundwater monitoring, as the remedial alternative for BBDA 3. The goal of the remediation at BBDA 3 was to remove all contaminated material, leaving in place soil that meets the established cleanup levels (Treadwell & Rollo, 2003c).

In accordance with the California Code of Regulations, Title 27, Subchapter 3, Section 20390, a site that has undergone clean closure (where all wastes and residues, contaminated subsoil, and other contaminated materials are removed or decontaminated at closure) must be shown to comply with the water quality protection standards or the cleanup levels presented in Section 3 of the RAP for three years. Table 1B from the *Draft Construction Completion Report Baker Beach Disturbed Areas 3 and 4* (Treadwell & Rollo, 2005a) is included at the end of this section and summarizes groundwater cleanup levels applicable to BBDA 3. These cleanup levels are based on the most stringent values for protecting drinking and surface waters. RAP-specified groundwater cleanup levels for some analytes are slightly lower than their QAPP analytical reporting limits. Applicable RAP-specified cleanup levels are also listed on Tables A-14-1 through A-14-4.

Prior to remediation excavation activities, existing temporary piezometers BB3PZ100A and BB3PZ100B were abandoned. Following completion of excavation activities, two new groundwater monitoring wells (BB3GW100 and BB3GW101) and four seep monitoring locations: one new piezometer (BB3PZ101) and three new fixed water monitoring points (BB3SW100 through BB3SW102) were installed to monitor groundwater quality in the area of BBDA 3. The new well, piezometer and fixed water monitoring point sampling locations are located near or within the former impacted area of BBDA 3 as shown on Figure A-14-1.

The monitoring well, piezometer and fixed water monitoring point sampling locations were installed in December 2004 after the completion of all excavation activities, but prior to the start of revegetation activities. Soil borings were advanced below the water table to total depths of 37 feet bgs and 32 feet bgs for installation of wells BB3GW100 and BB3GW101, respectively. On 13 December 2004, piezometer BB3PZ101 was installed in a hand-auger boring to a total depth of 18 feet. Three fixed water monitoring point installations were also installed at former BBDA 3 on 8 December 2004. Treadwell & Rollo performed the hand-augering and installation of the fixed water monitoring points. The boring and well completion logs are included in the *Draft Construction Completion Report Baker Beach Disturbed Areas 3 and 4, Appendix I* (Treadwell & Rollo, 2005a).

A fixed water monitoring point (BB3PZ102) was installed and added to the monitoring program in March 2006, at the request of the DTSC, approximately 30 feet southeast of BB3SW100. BB3PZ102 was also installed at former BBDA 3 on 8 December 2004. The fixed water monitoring point was installed in a hand-auger boring to a total depth of 6.5 feet. Treadwell &

Rollo performed the hand-augering and installation of the fixed water monitoring point on 11 March 2006. An additional seep location (BB3SW104) was identified and added to the program in February 2006.

4.0 GROUNDWATER MONITORING

The First and Second Quarters 2006 were the sixth and seventh monitoring events conducted at BBDA 3, since the new groundwater monitoring network was installed in December 2004. A total of eight monitoring wells, piezometers and fixed water monitoring points are used to calculate groundwater elevations and collect groundwater samples.

During the First and Second Quarters 2006, groundwater elevations were measured and groundwater sampling was attempted at BBDA 3 within the two groundwater monitoring wells (BB3GW100 and BB3GW101), the two piezometers (BB3PZ101 and BB3PZ102), and the four fixed water monitoring points (BB3SW100 through BB3SW102 and BBSW104). Piezometer location BB3PZ101 was dry during the Second Quarter 2006, and therefore no groundwater elevations or samples were collected from that well at that time. The proposed sampling schedules for First and Second Quarters 2006 are presented in Tables 1A and 1B.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements during the First and Second Quarters 2006 were collected on 6 March and 22 May 2006. Groundwater elevation maps showing groundwater contours and flow directions for BBDA 3 are included as Figures A-14-1 and A-14-2. Water level meters were calibrated on 6 March and 22 May 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

Groundwater elevations at BBDA 3 during the First Quarter 2006 ranged from 64.30 to 168.99 feet above PLLW in fixed water monitoring point BB3SW100 and monitoring well BB3GW100, respectively. Groundwater elevations at the BBDA 3 during the Second Quarter 2006 ranged from 63.38 to 168.44 feet above PLLW in fixed water monitoring point BB3SW100 and monitoring well BB3GW100, respectively. Groundwater elevations are presented in Table A-14-4.

To gain a broader understanding of groundwater gradients and flow directions in the BBDA 3 area, the groundwater elevations were evaluated with FS 5 measurements. During the First and Second Quarters 2006, the groundwater flow direction across BBDA 3 was observed to be in a southwesterly direction toward the Pacific Ocean following the general topographic trend. The groundwater gradient at BBDA 3 was estimated to be approximately 0.20 feet per foot during the First and Second Quarters 2006.

4.2 Monitoring Well Purging and Sampling

During the First Quarter 2006 at the request of the DTSC, piezometer BB3PZ102 and fixed monitoring point BB3SW104 were added to the sampling schedule to evaluate downgradient and surface water dissolved and total metal concentrations. Monitoring wells, fixed water monitoring points and piezometers were purged and sampled between 8 March and 16 March 2006. Groundwater samples were collected from monitoring well BB3GW100, from piezometers BB3PZ101 and BB3PZ102 and from fixed water monitoring points BB3SW100 through BB3SW102, and BB3SW104. Fixed water monitoring points BB3SW100 and BB3SW101 dewatered and only partial samples could be collected from these locations. Monitoring well BB3GW101 dewatered on 16 March and was left to recharge. A second attempt to purge and sample BB3GW101 took place on 21 March, however, the well contained insufficient water and therefore was not purged or sampled.

Monitoring wells, fixed water monitoring points and piezometers were purged and sampled on 23 May 2006. Groundwater samples were collected from monitoring well BB3GW100 and from fixed water monitoring points BB3SW102 and BB3SW104. Only a partial sample set was collected from BB3SW101 due to dewatering. Groundwater samples were not collected from BB3PZ102, BB3SW100, BB3SW101, or BB3GW101 due to either the location being dry or dewatering and not recharging sufficiently.

All sampling locations were sampled in accordance with methods shown in Tables 1A and 1B and procedures described in the FSP (Treadwell & Rollo, 2001a).

Purging equipment, purging volumes, purge water parameters, and sampling equipment for each sampling location are described in the purge records at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples were submitted to the project laboratory for the analyses shown in Tables 1A and1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed for the First and Second Quarters.

5.0 GROUNDWATER ANALYTICAL RESULTS

During the First Quarter 2006, groundwater samples were collected from monitoring well BB3GW100, piezometers BB3PZ101 and BB3PZ102 and from fixed water monitoring points

BB3SW100 through BB3SW102, and seep BB3SW104. During the Second Quarter 2006, groundwater samples were collected from monitoring well BB3GW100 and from fixed water monitoring points BB3SW101 and BB3SW102 and seep BB3SW104. Samples were analyzed for a combination of dissolved oxygen, general chemistry parameters, TDS, TPHg, TPHd, TPHfo, dissolved metals and total metals. All analyses were conducted in accordance with the groundwater sampling schedule (Tables 1A and 1B).

5.1 Dissolved Oxygen and General Chemistry Results

Dissolved oxygen and general chemistry results are presented in Table A-14-1. The table below summarizes new high and low dissolved oxygen and general chemistry analytical results when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry

General chemistry results for the First and Second Quarters 2006 at BBDA 3, are generally within historical ranges or are the initial sampling events for newer sampling locations.

During the First Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.56 mg/L to 8.32 mg/L within BB3GW100 and BB3SW104, respectively. During the Second Quarter 2006, dissolved oxygen was measured at concentrations ranging from 1.17 mg/L to 9.84 mg/L within BB3GW100 and BB3SW104, respectively. A sufficient amount of dissolved oxygen data has not yet been collected from all locations to develop trends, but higher concentrations of dissolved oxygen are observed in the shallower fixed water monitoring points and the piezometers versus the monitoring well.

General chemistry analytical results are presented in Table A-14-1. In general, nitrate and sulfate concentrations were slightly higher in the monitoring well and piezometer locations versus the fixed water monitoring points. Chloride fluctuated within historical ranges. Nitrite was not detected in any of the samples. Clear trends are not yet apparent for BB3D 3 general chemistry parameter concentrations. Future general chemistry results will be collected at BBDA 3 in accordance with the RAP and trends will be identified as they become apparent.

5.2 TPH Results

The analytical results for TPHg, TPHd, and TPHfo, along with the RAP-specified cleanup levels, are presented in Table A-14-2. The table below summarizes new high and low TPH analytical results when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Total Petroleum Hydrocarbons							
BB3GW100	TPH As Diesel C12-C24	1 / 10	< 50	< 50	--	78 *	µg/L
BB3PZ101	TPH As Gasoline C7-C12	1 / 3	< 50	< 50	--	78 *	µg/L
	TPH As Diesel C12-C24	1 / 3	< 50	< 50	--	81 *	µg/L

TPHg was detected for the first time at BBDA 3 at a concentration of 78 µg/L within BB3PZ101, during the First Quarter 2006.

TPHd was detected at concentrations of 78 µg/L and 81 µg/L within BB3GW100 and BB3PZ101, respectively, during the First Quarter 2006.

TPH compounds were not detected above laboratory limits within any other groundwater or surface water samples collected from BBDA 3 during the First and Second Quarters 2006. Clear

trends are not yet apparent for BB3D 3 TPH concentrations. TPH results will be collected at BBDA 3 in accordance with the RAP and trends will be identified as they become apparent.

5.3 Total and Dissolved Metals Results

The total and dissolved metals results for First and Second Quarters 2006, along with RAP-specified cleanup levels, are presented in Table A-14-3.

The following table summarizes new high and low dissolved metals results for the First and Second Quarters 2006 when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed.

	Total Dissolved Solids	4 / 4	NS	NS	348	400	mg/L
	Zinc	1 / 4	NS	NS	< 20	24	µg/L
	Zinc	1 / 4	NS	NS	< 20 *	24	µg/L

Qualified data in the table above is indicated with an asterisk (*).

The majority of the dissolved metals concentrations measured during the First and Second Quarters 2006 are below RAP-specified cleanup levels. Results exceeding RAP-specified cleanup levels are discussed below.

- Dissolved chromium was detected at 60 µg/L and 64 µg/L within BB3SW102 during the First and Second Quarters 2006, respectively. The RAP-specified cleanup level for dissolved chromium is 50 µg/L. No other dissolved metals were reported in excess of RAP-specified cleanup levels during First or Second Quarters 2006.

The following table summarizes new high and low total metal results for the First and Second Quarters 2006 when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Total							
BB3SW104	Nickel	4 / 4	NS	NS	37	45	µg/L
	Potassium	3 / 4	NS	NS	< 5,000 *	1,600	µg/L
	Sodium	4 / 4	NS	NS	44,000	54,000	µg/L
	Vanadium	4 / 4	NS	NS	21	29	µg/L
	Zinc	4 / 4	NS	NS	50	62	µg/L

RAP-specified cleanup levels apply only to dissolved metals. These detections were in unfiltered samples; thus the reported concentrations are not representative of dissolved metals in groundwater. Significant total metals results are discussed below.

- Total Arsenic was detected at 39 µg/L within BB3PZ102 during the Second Quarter 2006.
- Total chromium was detected at 170 µg/L within BB3SW102 during the First Quarter 2006.
- Total copper was detected at 96 µg/L within BB3PZ102 during the First Quarter 2006.
- Total nickel was detected at 1,200 µg/L within BB3PZ102 during the First Quarter 2006.
- Total zinc was detected at 480 µg/L within BB3PZ102 during the First Quarter 2006.

Clear trends are not yet apparent for BB3D 3 total and dissolved metal concentrations. Future total and dissolved metals results will be collected at BBDA 3 in accordance with the RAP and trends will be identified as they become apparent.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Both BBDA 3 temporary piezometers were abandoned following the Second Quarter 2004, prior to commencement of remedial construction activities. No groundwater monitoring activities took place at BBDA 3 during the Third Quarter 2004 because the remedial action was in progress and no groundwater monitoring wells, seep monitoring locations had yet been established. Following the excavation activities, two groundwater monitoring wells and four seep monitoring points (one piezometer and three fixed water monitoring points) were installed and included in the Presidio-wide Groundwater Monitoring Program. At DTSC's request, an additional piezometer and seep location are also now sampled. No significant trends were identified during the First and Second Quarters 2006 at BBDA 3. Future detections and trends will continue to be monitored and evaluated in accordance with the RAP.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.
2 - Piezometer was abandoned prior to the remedial action following Second Quarter 2004 in preparation for the remedial action.
3 - BB3PZ101 was formerly named BB3SW103.
4 - Groundwater cleanup levels were taken from the *Remedial Action Plan for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4, Presidio of San Francisco, California* (Treadwell & Rollo, 2003c).
mg/L - milligrams per liter
NA - not analyzed
NM - not measured
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.
2 - Groundwater cleanup levels were taken from the *Remedial Action Plan for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4, Presidio of San Francisco, California* (Treadwell & Rollo, 2003c).
3 - BB3PZ101 was formerly named BB3SW103.
4 - **Bold** numbers indicate concentrations of dissolved metals which exceed cleanup criteria. RAP cleanup criteria apply only to dissolved metals concentrations.
All metals results represent dissolved metals, unless indicated as "total" in the left-hand column for total metal results.
mg/L - milligrams per liter
µg/L - micrograms per liter
NA - not analyzed
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

	03/06/06	Flowing	66.07	66.07	Surface

Notes
1 - All depth to water measurements are an average of three measurements recorded in the field.
2 - Value indicates bottom of casing elevation in PLLW.
3 - BB3PZ101 was formerly named BB3SW103. Additionally, the depth to water measurement (14.45 feet) during the Fourth Quarter 2004 was measured from the ground surface. Subsequently, the ground and the top of casing elevations were surveyed and the depth to water measurement was converted to a top of casing measurement (16.80 feet).

FMP - Fixed Water Monitoring Point
MW - Monitoring Well
PZ - Piezometer
feet PLLW - feet above Presidio lower low water vertical datum

LANDFILL 10
APPENDIX SECTION A-15
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Landfill 10 is located in the southwestern portion of the Presidio within the former U.S. Public Health Services Hospital (PHSH) area (Figure 1). The site elevation is between approximately 110 and 190 feet above the PLLW datum (Figure A-15-1).

In 1874, the War Department established the area as a full-service U.S. Merchant Marine Hospital (USACE, 1990; ANL, 1989). Hospital operations were transferred in 1927 to the former PHSH. In the 1930s, the hospital was demolished and replaced by the existing site structure. Demolition debris from the first hospital is believed to have been placed in Landfill 10. The hospital was closed in 1981.

Since September 1994, monitoring wells at Landfill 10 have been analyzed for BTEX, TPH, dissolved metals, TDS and/or general chemistry parameters. A summary of analytical results are presented in Tables A-15-1 through A-15-3.

2.0 SITE DESCRIPTION AND GEOLOGY

Landfill 10 is located in the Lobos Creek Groundwater Area of the Lobos Creek Groundwater Basin (Figure 1). The depth to groundwater ranges from approximately 5 to 43 feet bgs and groundwater flow follows the general topographic trend toward the southwest (Montgomery Watson, 1996c).

The approximately two-acre site consists of a former helipad and parking lot (Stollar, 1993). The site is underlain by landfill debris consisting mainly of sand with construction debris and varying amounts of rock, clay, and silt. The landfill debris is underlain by dune sand. Beneath the sand is the Colma Formation, which in turn, overlies the Franciscan Formation bedrock (Montgomery Watson, 1996c).

3.0 PUBLIC HEALTH SERVICE HOSPITAL RECORD OF DECISION

In early 1995, the U.S. Army completed the Record of Decision (ROD) for the Former PHSH Area (PHSH ROD). The PHSH ROD addressed three remediation sites within the PHSH Area, including Landfill 10. The PHSH ROD proposed both soil and groundwater sampling at Landfill 10 to confirm that the fill material does not pose any threat to human health and the environment. In addition, the PHSH ROD required the installation of two monitoring wells downgradient of the fill material (LF10GW01 and LF10GW02) and one monitoring well upgradient of Lobos Creek (LF10GW03). These monitoring well locations are presented on Figure A-15-1. Following the installation of the wells, the PHSH ROD required quarterly groundwater monitoring for a minimum of 1 year to confirm that chemicals are not leaching from the fill material to the groundwater (Montgomery Watson, 1996c).

4.0 LANDFILL 10 SITE INVESTIGATION

The *Five-Year Review and Field Investigation Work Plan for Landfills 8 and 10* (FYR/WP) was finalized in October 2002 (URS, 2002). The objectives of the investigation at Landfill 10, as detailed in the FYR/WP, were as follows:

- To evaluate the stability of the existing site slopes under both static and dynamic (earthquake) loading conditions using a pseudo-static analysis;
- To select a seismically stable slope configuration;
- To evaluate a stable slope configuration with vegetative cover consistent with the Vegetation Management Plan and Environmental Assessment to prevent surface erosion;
- To characterize the subsurface distribution of geologic units (e.g., landfill waste, dune sand, Colma formation, and possibly bedrock, as well as the engineering properties of each unit);
- To investigate the approximate lateral extent of the landfill at the toe;
- To investigate the presence of site Potential Contaminants of Concern (PCOCs) in downgradient seeps located near Lobos Creek; and
- To install and sample one groundwater monitoring well (LF10GW100) to evaluate groundwater conditions within the landfill itself (the other three wells at the site are upgradient and downgradient).

The investigation was conducted between October and December 2002 and included:

- Five test borings near the crest of the landfill utilizing a truck-mounted drill rig to investigate subsurface stratigraphy and to provide samples for lithologic logging and laboratory testing;

- Five test borings on the steep south-facing slope of Landfill 10 utilizing portable equipment to provide information concerning the stratigraphy at the edge of the landfill, and samples for lithologic logging and laboratory testing of engineering properties;
- 13 test pit excavations in and around the existing parking lot and near the crest of the landfill slope to evaluate the approximate percentage and type of construction debris present in the landfill waste, as well as provide bulk samples for laboratory testing;
- Shallow hand auger borings to define the lateral extent of the landfill toe at the bottom of the fill slope;
- Two seep samples collected from the Lobos Creek area closest to Landfill 10; and
- One new monitoring well (LF10GW100) installed within the central-western portion of the landfill in the existing parking lot.

The *Five Year Review and Final Investigation Report for Landfills 8 and 10* (FYR) was submitted to the regulatory agencies and RAB in January 2004. A Focused Feasibility Study (FFS) for Landfills 8 and 10 has been prepared. Additionally, the Trust is currently writing a RAP and designing new remedial actions for the two landfill sites. The RAP is scheduled to be completed in 2008.

5.0 GROUNDWATER MONITORING

Landfill 10 has four associated monitoring wells and one surface water seep (Figure A-15-1). During the First Quarter 2006, groundwater elevations were measured at all four Landfill 10 wells and the surface water seep (Table 1A). During the Second Quarter 2006, three of the monitoring wells were measured (Table 1B). Monitoring well LF10GW02 and the surface water seep were inaccessible. Water-level meters were calibrated on 6 March and 22 May 2006. The calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

Groundwater samples were collected from Landfill 10 monitoring wells LF10GW01, LF10GW03 and LF10GW100, during the First Quarter 2006. Samples were not collected from monitoring well LF10GW02 and surface water seep LF10SP01 due to inaccessibility issues. Groundwater samples were collected from monitoring wells LF10GW01 and LF10GW03, during the Second Quarter 2006. Monitoring well LF10GW100 and surface water seep LF10SP01 were scheduled for sampling during the Second Quarter 2006, but were inaccessible due to dense, overgrown vegetation. All sampling was conducted in accordance with Tables 1A and 1B during the First and Second Quarters 2006.

5.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 6 March at all Landfill 10 monitoring wells and surface seep LF10SP01 during the First Quarter 2006. During the Second Quarter 2006, groundwater measurements were collected on the 22 May from three of the monitoring wells. Monitoring well LF10GW02 and the surface water seep, LF10SP01, were inaccessible and therefore, where not visited during the Second Quarter 2006. Groundwater elevations are summarized in Table A-15-4. Groundwater elevation maps showing groundwater contours and flow directions for Landfill 10 are included as Figures A-15-1 and A-15-2.

During the First Quarter 2006, groundwater elevations ranged from 102.78 to 143.06 feet above PLLW in LF10GW02 and LF10GW03, respectively (Figure A-15-1). During the Second Quarter 2006, groundwater elevations ranged from 109.90 to 144.45 feet above PLLW in LF10GW01 and LF10GW03, respectively (Figure A-15-2). In addition to the groundwater monitoring wells, the approximate location of LF10SP01 is posted on Figures A-15-1 and A-15-2. The groundwater elevations during the First and Second Quarters 2006 are consistent with historical elevations measured at Landfill 10.

Groundwater was determined to flow to the southwest following the general topographic trend during both quarters. The groundwater gradient was calculated to be approximately 0.15 feet per foot during the First Quarter 2006, and 0.14 feet per foot during the Second Quarter 2006. Groundwater gradients and flow directions are consistent with previous findings.

5.2 Monitoring Well Purging and Sampling

Landfill 10 monitoring wells LF10GW01, LF10GW03 and LF10GW100 were sampled during the First Quarter 2006. Samples were not collected from monitoring well LF10GW02 and surface water seep LF10SP01 due to overgrown vegetation and an inability to carry sampling equipment to these sampling locations. Groundwater samples were collected from monitoring wells LF10GW01 and LF10GW03, during the Second Quarter 2006. Monitoring well LF10GW02 and surface water seep LF10SP01 were scheduled for sampling during the Second Quarter 2006, but were not sampled due to overgrown vegetation and an inability to carry sampling equipment to these sampling locations. First Quarter 2006 sampling took place on 17 and 20 March 2006. Second Quarter 2006 sampling took place on 25 May 2006. All purging and sampling was performed using methods shown in Tables 1A and 1B and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, purging volumes, purge water parameters, and sampling equipment for each monitoring well and the surface water seep are described in the purge records at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

5.3 Groundwater Analytical Program

All groundwater and surface water samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers collected from each well are described in the purge records at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main report discusses the QA/QC sampling and analysis performed for the First and Second Quarters 2006.

6.0 GROUNDWATER ANALYTICAL RESULTS

During the First Quarter 2006, Landfill 10 monitoring wells LF10GW01, LF10GW03 and LF10GW100 were sampled and analyzed for general chemistry parameters, dissolved metals, TDS, dissolved oxygen, BTEX, and MTBE. In addition to these parameters, LF10GW100 was also analyzed for TPHg, TPHd, and TPHfo. Monitoring wells LF10GW01 and LF10GW03 were sampled during the Second Quarter 2006 for TPHg, TPHd, and TPHfo. Monitoring well LF10GW02 and surface water seep LF10SP01 were not sampled during the First and Second Quarters 2006 as they were inaccessible.

The TPHfo standard currently being used is a TPH as motor oil standard, as defined by the Presidio QAPP, with a carbon range of C24-C36. Section 5.4.3.1 in the main text discusses the data compatibility issues associated with TPH analyses.

6.1 Dissolved Oxygen

Table A-15-1 presents dissolved oxygen results. During the First Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.77 to 3.4 mg/L within LF10GW03 and LF10GW01, respectively. All measured concentrations of dissolved oxygen were within the range of historical values for Landfill 10. Dissolved oxygen was not measured during the Second Quarter 2006.

6.2 General Chemistry Results

General chemistry results are presented in Table A-15-1. General chemistry results were generally within historical ranges within LF10GW01, LF10GW03 and LF10GW100 during the First Quarter 2006. General chemistry results outside of historical bounds are discussed below.

Total alkalinity and bicarbonate were detected at new high concentrations of 250 mg/L within LF10GW01 during the First Quarter 2006. The previous high concentrations were both 190 mg/L.

All other general chemistry results detected at Landfill 10 during the First Quarter 2006 are generally consistent with historical values.

6.3 TPH Results

Monitoring well LF10GW100 was the only Landfill 10 monitoring well sampled for TPH analyses during the First Quarter 2006 (Table A-15-2). No TPH was detected above the laboratory's reporting limits for TPHg (<50 µg/L), TPHd (<50 µg/L) or TPHfo (<300 µg/L).

Monitoring wells LF10GW01 and LF10GW03 were sampled for TPH during the Second Quarter 2006 (Table A-15-2). No TPH was detected above the laboratory's reporting limits for TPHg (<50 µg/L), TPHd (<50 µg/L) or TPHfo (<300 µg/L) within LF10GW01 and LF10GW03 during the Second Quarter 2006.

6.4 BTEX and MTBE Results

Landfill 10 monitoring wells LF10GW01, LF10GW03, and LF10GW100 were sampled for BTEX and MTBE during the First Quarter 2006. No BTEX compounds were detected in any of the samples analyzed from Landfill 10 during the First Quarter 2006 as presented in Table A-15-2.

MTBE was detected at a concentrations of 3.6, 2.4, and 2.1 µg/L in monitoring wells LF10GW01, LF10GW03, and LF10GW100, respectively, during the First Quarter 2006. Previously, MTBE has been detected sporadically in samples from Landfill 10 monitoring wells and surface water seep LF10SP01.

A review of current and historical MTBE data and geographic distribution at Landfill 10 does not reveal clear trends in MTBE concentrations at Landfill 10. For example, MTBE has only been detected twice in monitoring well LF10GW02 and surface water seep LF10SP01. MTBE has been detected three times in monitoring well LF10GW01, four times in LF10GW03, and five times in LF10GW100. The concentrations of MTBE detected in Landfill 10 monitoring wells range from 2.1 to 11 µg/L. MTBE does not currently have an identified source at Landfill 10. Additionally, MTBE has not been detected in consecutive quarters within any of the Landfill 10 monitoring wells. MTBE detections at Landfill 10 may be caused by environmental factors such as runoff and the use of internal combustion engines, and may not represent a significant impact to groundwater.

MTBE has also been sporadically detected within wells located at the Building 1065, Building 231/207 and Commissary/PX Areas. These sites are all located in areas where high vehicular traffic is present, which supports the theory that the MTBE present may be caused by environmental factors such as runoff and the use of internal combustion engines.

6.5 Total and Dissolved Metals and TDS Results

Total and dissolved metals and TDS results for Landfill 10 are presented in Table A-15-3. The table below summarizes new high and low total and dissolved metals and TDS analytical results for the First and Second Quarters 2006 when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the commencement date of sampling, and on the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
LF10GW100	Potassium	13 / 15	< 5,000 *	2,300	< 500 *	--	µg/L

Qualified data in the table above is indicated with an asterisk (*).

The only new low potassium was a laboratory reporting limit of 500 µg/L in LF10GW100. Potassium concentrations within LF10GW100 have previously ranged between 1,300 and 2,300 µg/L.

Metal detections will continue to be monitored at Landfill 10 sampling locations and trends will be developed as they become apparent.

7.0 CONCLUSIONS AND RECOMMENDATIONS

MTBE was detected for the fifth time in monitoring well LF10GW100 during the First Quarter 2006 at a concentration of 2.1 µg/L. However, MTBE has never been detected above its Drinking Water Cleanup Level of 13 µg/L, as listed in the Cleanup Levels Document (EKI, 2003), within LF10GW100 and therefore, these detections do not appear to be significant.. Additionally, clear trends in MTBE concentrations or geographic distribution have not been identified and this detection may not represent an impact to groundwater from Landfill 10. No other significant trends or observations were identified at Landfill 10 during the First and Second Quarters 2006.

The *Five Year Review and Final Investigation Report for Landfills 8 and 10* (FYR) was submitted to the regulatory agencies and RAB in January 2004. The FFS for Landfills 8 and 10 has been prepared. Additionally, the Trust is currently preparing a RAP and designing new remedial actions for the two landfill sites. The RAP is scheduled to be completed in 2007.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in
mg/L - milligrams per liter
NA - Not analyzed
NM - Not measured
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain-of-custody.
µg/L - micrograms per liter
NA - Not analyzed
Y - Sample exhibits a fuel pattern that does not resemble the standard.
Z - Sample exhibits unknown single peak or peaks.
MTBE - Methyl tertiary butyl ether
BTEX - benzene, toluene, ethylbenzene, and xylenes
TPH - Total petroleum hydrocarbons
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
All metal results represent dissolved metals, unless indicated as "total" in the left-hand column, for total metal results.
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in their respective quarterly report.

2 - Beginning with the Second Quarter 2003, the Trust requested that all surface water seep samples be analyzed for total metals instead of dissolved metals. During Second Quarter 2003, the project laboratory filtered the metals sample for LF10SP01 and, therefore, the results are dissolved metals. Beginning with the Second Quarter 2004, the Trust requested that all surface water seep samples be analyzed for dissolved and total metals. Samples analyzed for total metals are not filtered in the field.

Groundwater samples collected from monitoring wells LF10GW01 through LF10GW100 were field filtered and analyzed for dissolved metals, except for samples collected from LF10GW100 during December 2002 and February 2003, which were analyzed for total metals.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed

Notes

1 - All depth to water measurements are an average of three measurements recorded in the field.

2 - The lid of monitoring well LF10GW100 has been surveyed by the Trust (175.60 feet PLLW). The elevation difference between the monitoring well lid and the top of casing was measured in the field and has been verified to be 0.30 feet. Therefore, the LF10GW100 top of casing elevation is approximately 175.30 feet PLLW.

3 - Approximate elevation.
MW- Monitoring well
NM - Not measured, location was not accessible
feet PLLW - feet above Presidio Lower Low Water vertical datum

LEGEND

- Approximate Direction of Groundwater Flow
- Groundwater Contour (Contour Interval : 5 ft)
- Presidio Boundary
- Topographic Contour (Contour Interval : 10 ft)
- 1801 Building and Number
- LF10GW03 143.06 — Groundwater Monitoring Well March 2006 Groundwater Elevations
- LF10SP01 109.0 — Surface Water Seep at the headwater of Lobos Creek; location and elevation are approximate
- * — Groundwater elevation used for contouring is considered approximate (refer to Table A-15-4 for details)
- Approximate Extent of Landfill

Notes:
Groundwater elevation data collected on 6 March 2006.

Horizontal Datum: NAD 27, CA State Plane Coordinates, Zone 3, feet

Vertical Datums: (groundwater) Presidio Lower Low Water (ft. PLLW) (topography) North American Vertical Datum, NAVD88

COMMISSARY/POST EXCHANGE AREA
APPENDIX SECTION A-16
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Commissary/Post Exchange (PX) Area is located in the north-central portion of the Presidio (Figure 1), in the area surrounding the Commissary (Building 610) and the PX (Building 605). Site elevations range from approximately 9 to 15 feet above the PLLW datum and the ground surface slopes gently to the north-northwest, towards San Francisco Bay.

Prior to the construction of the Commissary and Crissy Field Tidal Marsh, the area was part of the Motor Pool used by the Army for vehicle fueling and maintenance and included aboveground gasoline storage tanks (ASTs), underground fuel and waste oil storage tanks (USTs), a pump shed and an auto shop. The area was also used for the loading and unloading of railroad tank cars and was crossed by now abandoned underground fuel distribution pipelines.

Three wells (610GW101 through 610GW103) were installed at the site in 2001 as part of an interim removal action. These wells have been sampled quarterly since August 2001. Samples from these wells were analyzed for TPH, BTEX and general water chemistry. Additional monitoring wells were installed as part of Site Investigation (SI) activities in 2002 and 2003. Metals and TDS analyses, sampling of the additional wells, and two surface water seep sampling locations (610SP01 and 610SP02) were added to the groundwater monitoring program beginning in the Third Quarter 2002.

To evaluate changing redox conditions, pH, temperature and oxygen-reduction potential (ORP) were added to the program in the First Quarter 2006. The *Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California* (MACTEC, 2006), concluded that ORP is a good indicator for evaluating changing redox conditions. The First Quarter 2006 pH, temperature and ORP data are presented in Table A-16-1 and will be used in the ongoing redox evaluations at CAP sites.

Summaries of analytical results are presented in Tables A-16-1 through A-16-7 in this section.

2.0 SITE DESCRIPTION AND GEOLOGY

Based on historical groundwater level measurements, groundwater beneath the Commissary/PX Area does not appear to be tidally influenced and is typically present from approximately 3 to 6 feet bgs (Treadwell & Rollo, 2003b). Groundwater beneath the site generally flows northward towards the San Francisco Bay.

The Commissary and Crissy Field Tidal Marsh are located in an area of former tidal marshland. This marshland was filled in 1915 with hydraulically placed sand obtained from offshore sources (referred to as "the 1915 sand"). More recently, additional fill material was placed on top of the 1915 sand. The 1915 sand is laterally continuous over Crissy Field and locally ranges between 3 to 6 feet thick. The 1915 sand is underlain by native, highly plastic clay (Bay Mud) (Treadwell & Rollo, 2003b).

3.0 INTERIM SOIL REMOVAL ACTION

In mid-November 1999, the Trust became aware of groundwater seeps in the southwest corner of the new Crissy Field Tidal Marsh that contained detectable concentrations of TPHg. This area of the tidal marsh is north of the Commissary (Figure A-16-1). Throughout 2000, the Trust conducted a series of investigations to identify and delineate the source of TPHg in the groundwater seeps. These investigations have included:

- Sampling the groundwater seeps,
- Advancing 48 exploratory soil borings,
- Shallow groundwater sampling, and
- Excavating 11 test pits in the area of the Commissary's northwestern parking lot and adjacent parts of Mason Street.

These investigations documented concentrations of TPHg in the groundwater seeps up to 0.81 mg/L, concentrations of TPHg in shallow groundwater up to 3.4 mg/L, and concentrations of TPHg and TPHd in shallow soil up to 21,000 mg/kg (Treadwell & Rollo, 2002a).

In the *Commissary Seeps Interim Source Removal Action Plan* (Action Plan) (Trust, 2000), the Trust proposed an interim source removal action to reduce the TPH concentrations in the soil in the area between the Commissary and the Crissy Field Tidal Marsh. Historical data collected by the Army, Trust, and members of the public suggested that other areas of the Commissary/PX Area may be impacted with petroleum hydrocarbons.

At the suggestion of the Regional Water Quality Control Board (RWQCB), an investigation to evaluate contaminant attenuation characteristics was performed prior to the interim source removal excavation. This investigation was conducted to estimate the partitioning coefficient between the 1915 sand and the shallow groundwater, as well as the dilution attenuation factor (DAF) and the

retardation coefficient within the 1915 sand. The evaluation also provided additional information to assist with decisions regarding potential future remedial actions at the Commissary/PX Area and possibly other locations at Crissy Field. A complete discussion of the estimated partitioning coefficients, DAFs, and retardation coefficients can be found in the *Draft Commissary Seeps Interim Removal Action Report* (Treadwell & Rollo, 2002a).

The interim source removal action took place in two phases to minimize the disturbance of Mason Street. Phase 1 of the excavation took place between March and April 2001, and Phase 2 of the excavation took place between May and July 2001. The action consisted of removing and disposing of 3,750 tons of soil that contained petroleum hydrocarbons, backfilling the excavation with clean fill, evaluating the contaminant attenuation characteristics of the 1915 sand, and monitoring groundwater. Three monitoring wells (610GW101 through 610GW103) were installed in July 2001. The scope of work was performed in accordance with the Action Plan, as approved by the RWQCB and the Department of Toxic Substances Control (DTSC) (Trust, 2000).

The interim action was followed by a comprehensive SI of the entire Commissary/PX Area conducted by the Trust in 2002 and 2003 (Treadwell & Rollo, 2002c).

4.0 COMMISSARY/PX AREA SITE INVESTIGATION

The Commissary/PX Area SI was conducted in two phases. Phase 1 of the investigation was conducted in July and August 2002 and consisted of the following:

- Drilling 87 soil borings to depths ranging from 2 to 10 feet bgs,
- Collecting 193 soil samples for laboratory analyses (chemical and geotechnical),
- Collecting 47 groundwater grab samples from 41 soil borings,
- Installing nine groundwater monitoring wells (600GW101 through 600GW109) in the shallow (A1) groundwater zone,
- Collecting groundwater level measurements on four different days, and
- Sampling the new groundwater monitoring wells (600GW101 through 600GW109).

Based on the results of the Phase 1 SI, Phase 2 boring locations and a sampling and analysis plan were proposed. The Phase 2 site investigation was conducted in January 2003 and consisted of the following:

- Drilling 57 soil borings to depths ranging from 2 to 14 feet bgs,
- Collecting 204 soil samples for laboratory analyses, and
- Collecting 7 groundwater grab samples from 6 borings.

The results of the Phase 1 and Phase 2 site investigations are included in the Draft SI Report for the Commissary/PX Study Area (Treadwell & Rollo, 2003b).

5.0 COMMISSARY/PX CORRECTIVE ACTION PLAN

The *Revised Final Corrective Action Plan Commissary/PX Study Area, Presidio of San Francisco, California* (CAP) was prepared and approved during Third Quarter 2006 (Treadwell & Rollo, 2006). The CAP selected excavation and offsite disposal, capping and land use controls (LUCs), and groundwater monitoring for Accessible Locations. Due to the uncertainty concerning future land uses and the status of Building 610 as well as the extent and volume of soil contamination, for Less Accessible Location situated underneath Building 610, a combination of three alternatives was selected:

- No Marsh Expansion (Selected Alternative: Capping and LUCs);
- Marsh Expansion with Demolition of Building 610 (Excavation and Off-Site Disposal and Capping and LUCs);
- Marsh Expansion with Building 610 In-Place (In Situ Soil Remediation and LUCs).

These alternatives provide for the cleanup and long term management of TPH-, PAH-, and metal-contaminated soil beneath the building. In addition, the combination of the three alternatives offers flexibility with respect to the future expansion of the Crissy Field Marsh and the future status of Building 610. By implementing an LUC for the area covered by the building until a determination is made by the Trust and NPS regarding whether the Crissy Field Marsh will be expanded into the area, significant costs associated with remediation of soil underneath the building are minimized.

The CAP outlines a phased implementation approach that will allow uncertainties to be addressed as better information regarding future land use and the potential for Crissy Field Marsh Expansion becomes available. During Phase 1, soil will be removed from all portions of the Study Area within Area A and portions of Area B located within approximately 150 feet of the present Crissy Field Marsh shoreline (Figure A-16-1). The objective of Phase 1 is to remove soil in petroleum impacted areas the pose a potential threat to Crissy Field Marsh and land uses within Area A (Figure A-16-1). Phase 2 of CAP implementation will occur within the remainder of the Study Area and will commence following decisions regarding the potential expansion of Crissy Field Marsh. Cleanup will be conducted to protect the marsh and human land use, as appropriate.

Groundwater and surface water monitoring for arsenic and TPH in the vicinity of the Commissary Seeps Interim Removal Action are part of the recommended corrective action alternative. CAP cleanup levels are presented on Tables A-16-2 through A-16-7. The CAP groundwater and surface water monitoring program will be implemented as outlined in the *Phase*

I Corrective Action Plan Work Plan (Geomatrix, 2006) following completion of Phase 1 soil excavation and sampling activities which are currently underway.

6.0 GROUNDWATER MONITORING

The Commissary/PX Area has 12 associated groundwater monitoring wells and two surface water seep locations (Figure A-16-1). Groundwater elevations were collected at all 12 site wells during the First and Second Quarters 2006. The seeps were submerged during the First Quarter 2006 and were not flowing during the Second Quarter 2006.

Commissary/PX Area monitoring wells 600GW101 through 600GW109, 610GW101 through 610GW103 were sampled during the First Quarter 2006, in accordance with the proposed sampling schedule (Table 1A). Seeps 610SP01 and 610SP02 were submerged during the First Quarter 2006 groundwater elevation survey. However, the seeps were subsequently exposed and seep samples were collected by Blaine Tech, as they have been historically, by digging a small hole and allowing groundwater to seep into the depression. The water was then collected with a disposable bailer and placed in laboratory-supplied containers for analysis. Commissary/PX Area monitoring well and seep locations are shown on Figure A-16-1.

During the Second Quarter 2006, groundwater samples were collected from seven site wells (600GW101, 600GW105, 600GW106, 600GW108, and 610GW101 through 610GW103), in accordance with Table 1B. Groundwater seeps 610SP01 and 610SP02 were not flowing during the Second Quarter 2006, and no samples were collected from these locations.

Water level meters were calibrated on 6 March and 22 May 2006. The calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

6.1 Groundwater-Level Measurements and Interpretation

During the First Quarter 2006, the Commissary/PX Area monitoring wells were gauged between 12:44 PM and 1:30 PM on 6 March 2006. Observed low tide on 6 March 2006 was at 11:08 AM with a magnitude of 0.8 feet above PLLW.

During the Second Quarter 2006, the Commissary/PX monitoring wells were gauged between 2:37 PM and 3:02 PM on 22 May 2006. Observed low tide on 22 May 2005 was at 8:06 PM with a magnitude of 0.79 feet above PLLW.

Although groundwater does not appear to be tidally influenced at the Commissary/PX Area, as a precaution an attempt was made during the First and Second Quarters 2006 to gauge the Commissary/PX monitoring well water levels within a period of approximately one hour so that any potential tidal effects on groundwater elevation were minimal. Predicted and observed tidal times and magnitudes during the First and Second Quarters 2006 are presented in Tables 2A and 2B and Figures 2A and 2B of the main text, respectively. Tidal predictions and observations are taken from

the National Oceanic and Atmospheric Administration's (NOAA) Center for Operational Oceanographic Products and Services (CO-Ops) website. The First and Second Quarters 2006 Commissary/PX Area groundwater elevations are presented in Table A-16-8.

During the First Quarter 2006, groundwater elevations at the Commissary/PX Area ranged from 6.96 to 14.16 feet above PLLW in monitoring wells 600GW102 and 600GW105, respectively (Figure A-16-2). Surface water seeps 610SP01 and 610SP02 were submerged. During the Second Quarter 2006, groundwater elevations at the Commissary/PX Area ranged from 6.39 to 14.47 feet above PLLW in monitoring wells 600GW102 and 600GW105, respectively (Figure A-16-3). Surface water seeps 610SP01 and 610SP02 were not flowing during the Second Quarter 2006.

Groundwater generally flowed north towards the Crissy Field Marsh and San Francisco Bay (Figures A-16-2 and A-16-3) during both the First and Second Quarters 2006. During the First Quarter 2006, groundwater gradients in the Commissary/PX Area were estimated to be approximately 0.011 feet per foot in the western half of the area and 0.003 feet per foot in the eastern half of the area. During the Second Quarter 2006, groundwater gradients in the Commissary/PX Area were estimated to be approximately 0.012 feet per foot in the western half of the area and 0.0004 feet per foot in the eastern half of the area.

6.2 Monitoring Well Purging and Sampling

During the First Quarter 2006, all 12 Commissary/PX Area monitoring wells (600GW101 through 600GW109 and 610GW101 through 610GW103) and the two surface water seeps, 610SP01 and 610SP02 were purged and sampled on 7 March through 21 March 2006. During the Second Quarter 2006, seven Commissary/PX Area monitoring wells (600GW101, 600GW105, 600GW106, 600GW108, and 610GW101 through 610GW103) were purged and sampled on 23 May 2006. The two surface water seeps were not sampled during the Second Quarter 2006 because they were not observed to be flowing.

All samples were collected using methods shown in Tables 1A and 1B and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a). Purge equipment, purging volumes, purge water parameters, and sampling equipment for each monitoring well are described in the purge records at the conclusion of this subsection. Purge water was stored, for future disposal, in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

6.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main report discusses the QA/QC sampling and analysis performed during the First and Second Quarters 2006.

7.0 GROUNDWATER ANALYTICAL RESULTS

During the First and Second Quarters 2006, groundwater samples collected from the Commissary/PX Area were analyzed for general chemistry, dissolved oxygen, 14 dissolved metals, TDS, sulfide, TPHg, TPHd, and TPHfo. In addition to the above analyses the following analyses were also conducted:

- VOCs analysis during the First Quarter 2006 within 600GW102 through 600GW109.
- BTEX and MTBE analyses during the both the First and Second Quarters 2006 within 600GW101, and 610GW101 through 610GW103 and during the First Quarter 2006 only within both seeps (610SP01 and 610SP02).
- PAH analysis within 600GW102 through 600GW109 during the First Quarter 2006
- Seep samples were analyzed for total metals during the First Quarter 2006.

The TPHfo standard currently being used is a TPH as motor oil standard, as defined by the QAPP, with a carbon range of C_{24} to C_{36}.

Groundwater analytical results are presented in Tables A-16-1 through A-16-7. Additionally, in order to evaluate changing redox conditions, pH, temperature and oxygen-reduction potential (ORP) were added to the program in the First Quarter 2006 as outlined in the *Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California* (MACTEC, 2006), which concluded that ORP is a good indicator for evaluating changing redox conditions. The First Quarter 2006 pH, temperature and ORP data are presented in Table A-16-1 and will be used in the ongoing redox evaluations at CAP sites.

7.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-16-1. Dissolved oxygen meters are calibrated prior to sampling each day, as described in Section 5.4.1.1 of the main text.

During the First Quarter 2006, the concentrations of dissolved oxygen within the Commissary/PX Area monitoring wells ranged from 0.4 to 2.07 mg/L within monitoring wells 600GW105 and 600GW104, respectively. Dissolved oxygen was measured at new high concentrations of 1.19, 1.59 and 1.61 mg/L within monitoring wells 600GW101, 600GW102, and 600GW106, respectively, during the First Quarter 2006.

During the Second Quarter 2006, the concentrations of dissolved oxygen within the Commissary/PX Area monitoring wells ranged from 0.17 to 0.51 mg/L within monitoring wells 600GW106 and 600GW108, respectively. All dissolved oxygen concentrations measured during the Second Quarter 2006 were within the range of previously measured concentrations.

Dissolved oxygen was measured at surface water seeps 610SP01 and 610SP02 during the First Quarter 2006 at concentrations of 1.27 and 0.39 mg/L, respectively. The dissolved oxygen measured within seep 610SP02 during the First Quarter 2006, was a new low concentration for this location.

7.2 General Chemistry Results

General chemistry results are presented in Table A-16-1. General chemistry results at the Commissary/PX Area during the First and Second Quarters 2006 are generally within the range of concentrations previously detected at the site.

The following table summarizes new high and low general chemistry analytical results for the First and Second Quarters 2006 within the Commissary/PX Area when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed. Only the new high or new low concentrations are shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
600GW101	Alkalinity, Total	17 / 17	650	830	610	--	mg/L
	Bicarbonate	17 / 17	650	830	610	--	mg/L
	Chloride	17 / 17	95	130	74	--	mg/L
	Sulfide	5 / 9	< 0.04	0.12	--	0.14	mg/L
600GW104	Chloride	13 / 13	24	59	22	--	mg/L
600GW105	Sulfate	16 / 16	60	79	56	--	mg/L
600GW106	Chloride	15 / 15	28	46	--	47	mg/L
	Sulfate	15 / 15	39	83	--	92	mg/L
	Sulfide	1 / 8	< 0.04	< 0.04	--	0.07	mg/L
600GW107	Chloride	6 / 6	40	54	39	--	mg/L
	Fluoride	4 / 6	< 0.5	0.17	< 0.1	--	mg/L
	Nitrate	4 / 6	< 0.05	0.24	--	0.29	mg/L
600GW108	Chloride	22 / 22	25	92	18	--	mg/L
	Sulfate	22 / 22	26	90	22	--	mg/L
	Sulfide	1 / 10	< 0.04	< 0.05 *	--	0.07	mg/L
610GW102	Chloride	25 / 25	43	90	38	--	mg/L
	Nitrate	1 / 24	< 0.05	< 0.25	--	0.57	mg/L

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
610GW103	Alkalinity, Total	34 / 34	310	530	--	740	mg/L
	Bicarbonate	34 / 34	310	530	--	740	mg/L
	Nitrate	3 / 34	< 0.05	0.08	< 0.02 *	--	mg/L
	Sulfide	3 / 11	< 0.04	0.06	--	0.08	mg/L
610SP02	Chloride	12 / 12	170	12,000	120	--	mg/L

Qualified data in the table above is indicated with an asterisk (*).

Significant new high and low general chemistry results are discussed below.

During the Second Quarter 2006, nitrate was detected for the first time within monitoring well 610GW102 at 0.57 mg/L.

Nitrate, nitrite and fluoride concentrations had generally been higher within monitoring well 600GW108 than at other Commissary/PX Area wells in 2005. Monitoring well 600GW108 is located downgradient of the sewer lift station (Building 205). Elevated levels of these analytes may have been related to a leaking sewer line repaired by the Presidio Trust Utilities division in late 2004. The concentrations of these analytes appear to be trending back to normal site concentrations, which may be a result of the fixed leak.

Sulfide was detected at new high concentrations of 0.07 mg/L within monitoring wells 600GW106 and 600GW108 during the Second Quarter 2006. This is considered significant as it is the first time sulfide has been detected at either of these locations.

The remaining new high and low general chemistry concentrations from the First and Second Quarters 2006 can be attributed to natural fluctuations and are not considered significant. An evaluation of the redox state of site groundwater and relative general chemistry results can be found in Section 8.0.

The RPD between the primary and duplicate sample concentrations (740 and 410 mg/L, respectively) collected from monitoring well 610GW103 failed the RPD 50% acceptance criteria for total alkalinity at 57%.

7.3 Dissolved Gases and TOC

TOC and dissolved gases (ethane, ethene, and methane) were removed from the program for evaluation of redox conditions, in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, 2006).

An evaluation of the redox state of site groundwater and relative dissolved gas and TOC results can be found in Section 8.0.

7.4 TPH Results

All Commissary/PX samples were analyzed for TPHg, TPHd, and TPHfo during the First and Second Quarters 2006. The results of the TPH analyses are included in Table A-16-2 and detected results are discussed below.

During the First Quarter 2006, TPHg was detected at a concentration of 140 µg/L within monitoring well 600GW101. During the Second Quarter 2006, TPHg was detected at concentrations of 390 and 50 µg/L in monitoring wells 600GW101 and 610GW102, respectively.

TPHg was detected at concentrations of 83 and 66 µg/L in surface water seep 610SP01 and 610SP02, respectively.

TPHg concentrations did not exceed the 770 µg/L cleanup level during either the First or Second Quarters 2006.

THPd and TPHfo were not detected in any of the samples collected during the First or Second Quarters 2006 at the Commissary/PX Area.

TPHg concentrations detected within Commissary/PX Area monitoring wells and seeps during the First and Second Quarters 2006 were generally within the range of historical concentrations detected at the site. No TPH has ever been detected within Commissary/PX Area monitoring wells 600GW102 through 600GW106, or in monitoring wells 600GW108 and 600GW109.

7.5 VOC Results

All Commissary/PX Area monitoring wells, during the First Quarter 2006, and four Commissary/PX Area monitoring wells (600GW101 and 610GW101 through 610GW103), during the Second Quarter 2006 were analyzed for VOCs, either as VOCs and MTBE by EPA Method 8260B, or as BTEX and MTBE by EPA Method 8021B, in accordance with Tables 1A and 1B. Additionally, the two seeps (610SP01 and 610SP02) were sampled for BTEX and MTBE during the First Quarter 2006. The VOC results and cleanup levels are presented in Table A-16-3.

VOCs were not detected in the majority of samples analyzed during the First and Second Quarters 2006. Potentially significant detections of VOCs in Commissary/PX monitoring well and surface water seep samples are described below.

- MTBE was not detected in any Commissary/PX Area monitoring wells sampled during the First Quarter 2006. During the Second Quarter 2006, MTBE was

detected at concentrations of 3.3 and 3.2 µg/L in monitoring wells 600GW101 and 610GW103, respectively. These wells have previously had sporadic low level MTBE detections. Detected MTBE concentrations have been well below the 13 µg/L cleanup level.

7.6 PAH Results

Monitoring wells 600GW102 through 600GW109 were sampled for PAHs during the First Quarter 2006 (Table 1A). No Commissary/PX monitoring wells were sampled for PAHs during the Second Quarter 2006 (Table 1B). The PAH results are presented in Table A-16-4.

Acenaphthene was detected within 600GW103 at a concentration of 7.4 µg/L during the First Quarter 2006 which is within the range of previous detections at this location. Acenaphthene does not have a CAP-specified cleanup level. Anthracene and fluoranthene were detected within 600GW103 at an estimated concentration of 0.02 µg/L during the First Quarter 2006. These detections were only slightly above the laboratory reporting limit of <0.02 µg/L for these compounds and well below their respective cleanup levels of 770 and 300 µg/L. Fluoranthene was also detected within 600GW107 at a concentration of 0.03 µg/L during the First Quarter 2006, which is significantly less than its cleanup level of 300 µg/L. No other PAH compounds were detected at or above the laboratory reporting limit within any monitoring well samples during the First Quarter 2006.

7.7 Total and Dissolved Metals Results

Total and dissolved metals results are presented in Table A-16-5. Total results are identified as such in the leftmost column.

Samples collected from Commissary/PX Area monitoring wells were analyzed for 14 dissolved metals (aluminum, arsenic, cadmium, calcium, chromium, copper, iron, lead, magnesium, manganese, nickel, potassium, sodium, and zinc) and TDS during the First Quarter 2006. The following metals were added to the Commissary/PX Area monitoring program during the First Quarter 2005; aluminum, calcium, magnesium, potassium, and sodium. Manganese was added to the Commissary/PX Area metals list for 610-series wells and seeps starting with the Fourth Quarter 2004 and was added to the 600-series monitoring wells during the First Quarter 2005. Samples from both seeps are scheduled for quarterly analysis of total and dissolved metals.

The tables below summarize new high and low dissolved and total metal analytical results for the First and Second Quarters 2006 within Commissary/PX Area monitoring well and surface water seep samples when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed. Only the new high or the new low is shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
600GW101	Magnesium	7 / 7	43,000	55,000	--	56,000	µg/L
	Manganese	7 / 7	970	1,300	900	1,400	µg/L
	Potassium	7 / 7	13,000	16,000 *	10,000	--	µg/L
	Sodium	7 / 7	120,000	190,000	110,000	--	µg/L
600GW102	Calcium	2 / 2	150,000	150,000	--	180,000	µg/L
	Copper	1 / 9	< 1	< 20	--	1.1	µg/L
	Iron	2 / 2	3,000	3,000	2,500 *	--	µg/L
	Magnesium	2 / 2	46,000	46,000	--	54,000	µg/L
	Manganese	2 / 2	270	270	--	370	µg/L
	Potassium	2 / 2	9,900	9,900	--	12,000 *	µg/L
	Sodium	2 / 2	140,000	140,000	--	180,000	µg/L
600GW103	Calcium	2 / 2	110,000	110,000	--	130,000	µg/L
	Iron	2 / 2	11,000	11,000	--	13,000 *	µg/L
	Magnesium	2 / 2	31,000	31,000	--	35,000	µg/L
	Manganese	2 / 2	3,200	3,200	--	4,000	µg/L
	Sodium	2 / 2	84,000	84,000	--	86,000	µg/L
	Total Dissolved Solids	9 / 9	580	780	--	790 *	mg/L
600GW104	Calcium	2 / 2	120,000	120,000	--	130,000	µg/L
	Copper	4 / 13	< 1	1.2	--	1.4	µg/L
	Iron	2 / 2	1,100	1,100	--	2,200 *	µg/L
	Magnesium	2 / 2	52,000	52,000	50,000	--	µg/L
	Manganese	2 / 2	330	330	--	420	µg/L
	Potassium	2 / 2	6,500	6,500	5,500 *	--	µg/L
	Sodium	2 / 2	48,000	48,000	44,000	--	µg/L
600GW105	Iron	8 / 8	290	3,300	--	3,500	µg/L
	Magnesium	6 / 6	43,000	52,000	42,000	--	µg/L
	Sodium	6 / 6	100,000	130,000	96,000	--	µg/L
600GW106	Calcium	6 / 6	15,000	19,000	--	23,000	µg/L
	Magnesium	6 / 6	22,000	29,000	--	34,000	µg/L
	Manganese	6 / 6	600	1,000	--	1,300	µg/L
600GW107	Calcium	2 / 2	120,000	120,000	110,000	--	µg/L
	Iron	2 / 2	9,500	9,500	--	12,000	µg/L
	Magnesium	2 / 2	56,000	56,000	53,000	--	µg/L
	Manganese	2 / 2	2,700	2,700	--	2,800	µg/L

Qualified data in the table above is indicated with an asterisk (*).

Significant new high and low dissolved metal results are discussed below.

- During the Second Quarter 2006, dissolved arsenic was not detected for the first time above the laboratory reporting limit of 5 µg/L within 610GW102.
- Dissolved copper was detected at a new high concentration of 1.1 µg/L within the sample collected from 600GW102 during the First Quarter 2006. The detection within 600GW102 was the first time copper had been detected within this well.

During the First Quarter 2006, dissolved copper was detected at a new high concentration of 3.1 µg/L within the sample collected from 600GW108. The detection within 600GW108 exceeds the copper cleanup level of 2.9 µg/L.

- Magnesium, potassium, and sodium were all detected at new low concentrations of 40,000, 11,000, and 140,000 µg/L, respectively within the First Quarter 2006 seep 610SP01 sample. These concentrations were all significantly lower than the previous low detections of these analytes which were 74,000, 37,000, and 250,000 µg/L, respectively.

  Dissolved sodium was detected within the primary and duplicate samples at concentrations of 70,000 µg/L and 68,000 µg/L in well 600GW108. These concentrations were significantly higher than the previous high concentration of 38,000 µg/L. During the Second Quarter 2006, copper was not detected and sodium was present at previous levels (33,000 µg/L).

The First Quarter 2006 duplicate sample collected from monitoring well 600GW108 failed the RPD 50% acceptance criteria for dissolved copper. The RPD between the primary and duplicate samples was calculated to be 70%.

- Dissolved iron was detected at a new high concentration of 2,200 µg/L within the sample collected from 600GW104. This concentration is twice as high as the previous high concentration for this well (1,100 µg/L).
- Dissolved nickel was detected at a new high concentration of 8.3 µg/L within the QC duplicate sample collected from 610GW103 which exceeds the cleanup level of 7.1 µg/L. Dissolved nickel was not detected in the primary or duplicate sample at concentrations above the laboratory reporting limit of 20 µg/L.
- During the Second Quarter 2006, dissolved manganese was detected at a new high concentration of 45 µg/L within 600GW108 which is significantly higher than the previous high concentration for this well (20 µg/L). Manganese does not have a CAP-specified cleanup level.

	Sodium	3 / 3	160,000	590,000	140,000	--	µg/L

Qualified data in the table above is indicated with an asterisk (*).

Significant new high and low total metal results are discussed below. CAP-specified cleanup levels apply only to dissolved metals concentrations.

- Total aluminum, calcium, chromium, iron, lead, magnesium, nickel, potassium and sodium were all detected at new low concentrations within both seeps during the First Quarter 2006. Additionally, zinc was not detected at a new low laboratory reporting limit of <20 µg/L in surface water seep 610SP01, and manganese was detected at a new low concentration within surface water seep 610SP02.
- Total copper was detected at 22 µg/L within the surface water seep sample from 610SP02 during the First Quarter 2006.

Total metal results are generally significantly higher than their associated dissolved metals results because soil particles present in the samples likely contributed to the total metals concentrations. The total metals data collected to date at the Commissary/PX Area do not exhibit specific upward or downward concentration trends.

8.0 GROUNDWATER REDOX EVALUATION

Several parameters were measured in the field and in the laboratory to help determine the current redox state of groundwater at the Commissary/PX Area. The following parameters are currently included in the groundwater monitoring program at the Commissary/PX Area and will be monitored as indicators of changing redox potential within groundwater. The analytes and their use, in terms of determining the current redox state of site groundwater, are listed below.

- **Dissolved Oxygen** – Dissolved oxygen is a field measurement that is collected using a flow through cell or a down-hole probe. Low dissolved oxygen concentrations are typically associated with low redox potential and reducing environments. Dissolved oxygen in the presence of organic carbon is consumed by microorganisms during biodegradation processes and therefore low dissolved oxygen concentrations are indicative of microbial activity.
- **ORP** – ORP is a measurement that is collected in the field with the use of a flow through cell or a downhole meter. Groundwater is pumped directly from the aquifer into the flow through cell without being exposed to air or the downhole probe is lowered directly into the water column. The ORP is then measured by sensors within the flow through cell and recorded. ORP is a direct measurement of redox potential. However, ORP is not equivalent to redox potential. Depending on the type of sensor used and the temperature of the water, redox potential (eH) can be calculated. In general, the lower the ORP values the more reducing the water is, where as, the greater the ORP value the more oxidizing the water is.

  Many variables exist in the natural environment and accurate field measurements of in situ conditions are difficult to obtain. Field results will be used for comparison and discussion purposes.
- **Nitrate/Nitrite** – The process of denitrification reduces nitrate to nitrite, which is ultimately reduced to nitrogen gas in reducing environments. A decreasing nitrate concentration trend in groundwater can be indicative of low redox potential, microbial metabolism and a reducing environment. Increasing concentrations of nitrate are typically associated with a rising redox potential.
- **Sulfate/Sulfide** – Decreasing concentrations of sulfate indicate sulfate reduction is taking place due to a reducing environment. Decreasing concentrations of sulfate are usually associated with sulfide production (i.e. sulfide is a product of sulfate reduction) and the repeated presence of sulfide in groundwater further confirms that sulfate is being reduced.
- **TOC** – Decreasing trends in TOC over time indicate that microbial metabolism is taking place and TOC is being consumed.
- **Dissolved Arsenic, Iron and Manganese** – Increasing concentrations of arsenic, iron, and/or manganese can be typically associated with a decreasing redox potential. Decreasing concentrations of these metals in association with increasing sulfate concentrations can be associated with an increasing redox potential.

The above analytes and field measurements were collected within all Commissary/PX Area monitoring wells proposed for sampling during the First and Second Quarters 2006.

- Dissolved iron was detected in all monitoring wells and seeps during the First and/or Second Quarters 2006, except in upgradient monitoring well 600GW106. The only other

non-detect result for dissolved iron was within monitoring well 600GW108 during the Second Quarter 2006.

- Nitrate as nitrogen concentrations continue to be significantly higher within 600GW106 than in other site wells. The presence of nitrate indicates that there is not significant reduction and is another indication that the groundwater within this well is less reducing than in the other upgradient wells (600GW105, 600GW107, and 600GW109) and downgradient wells in the northern portion of the site. Additionally, nitrate was either not detected or detected at concentrations slightly above the laboratory's reporting limit within 600GW101, 600GW103, 610GW101, and 610GW103.
- ORP was measured prior to sampling within all groundwater monitoring wells at the Commissary/PX Area proposed for sampling during the First and Second Quarters 2006. The ORP values within 600GW101, 610GW101, and 610GW102 were the lowest measured at the site.
- pH was measured prior to sampling within all groundwater monitoring wells and seeps at the Commissary/PX Area during the First and Second Quarters 2006. The pH values within 600GW102, 600GW103, and 600GW109 were the lowest (ranging from 6.5 to 6.8) at the Commissary/PX Area during the First Quarter 2006.

In addition to the above evaluation, modified redox diagrams were developed for each Commissary/PX Area monitoring well and seep sampled for redox parameters. The redox diagrams were generated using the Sequence™ program and concentrations of dissolved oxygen, nitrate, manganese, iron, sulfate and methane and are plotted on Figure A-16-4. Each redox diagram consists of multiple axes, with each individual axis representing one of the above analytes. Each redox diagram is associated with one monitoring well location. The relative shape of each redox diagram represents an approximation of the redox state within the well studied. In general, the larger the polygon the more oxidizing the groundwater environment is at the well location, conversely, the smaller the polygon the more reducing the environment. The Commissary/PX Area redox diagrams (Figure A-16-4) illustrate the differing redox environments across the site.

9.0 CONCLUSIONS & RECOMMENDATIONS

Dissolved copper was detected at a new high concentration of 3.1 µg/L within the sample collected from 600GW108. Dissolved nickel was detected at a new high concentration of 8.3 µg/L within the sample collected from 610GW103. These detections were the only exceedances of the Commissary/PX Area cleanup levels for dissolved metals during the First and Second Quarters 2006.

Total aluminum, calcium, chromium, iron, lead, magnesium, nickel, potassium and sodium, were all detected at new low concentrations within both seeps during the First Quarter 2006. Additionally, zinc was detected at a new low concentration within surface water seep 610SP01,

and manganese was detected at a new low concentration within surface water seep 610SP02. The majority of total metals appear to be decreasing in concentration. Specific trends will be identified in future monitoring events as they become apparent.

No PAHs, VOCs, MTBE, or TPH compounds were detected above their applicable cleanup levels during either the First or Second Quarters 2006. No other significant findings or data trends were observed during either the First or Second Quarters 2006.

The Revised Final Commissary/PX Area CAP was approved by the RWQCB in June 2006 and Phase I of CAP implementation is currently underway. Once Phase I of the CAP is completed, groundwater monitoring will be conducted in accordance with the Revised Final CAP.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - The QC laboratory reported results for Nitrogen as Nitrate and Nitrite combined.
3 - The QC laboratory reported results for Nitrogen as Nitrate and Nitrite combined. However, the combined Nitrogen as Nitrate and Nitrite result (< 0.5 mg/L) was rejected during data validation.
mg/L - milligrams per liter
NA - Not analyzed
NM - Not measured
"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Groundwater cleanup levels were taken from the *Revised Final Corrective Action Plan for the Commissary/Post Exchange Study Area, Presidio of San Francisco, California* (Treadwell & Rollo, 2006)
Concentrations in **BOLD** indicate an exceedance of applicable cleanup levels.
µg/L - micrograms per liter
TPH - Total petroleum hydrocarbons
NA - Not analyzed
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Revised Final Corrective Action Plan for the Commissary/Post Exchange Study Area, Presidio of San Francisco, California* (Treadwell & Rollo, 2006).

Concentrations in **BOLD** indicate an exceedance of applicable cleanup levels.

µg/L - micrograms per liter

MTBE - Methyl tertiary butyl ether

VOC - Volatile organic compound

NA - Not analyzed

ND - Not detected

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

-- - cleanup level not established

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Groundwater cleanup levels were taken from the *Revised Final Corrective Action Plan for the Commissary/Post Exchange Study Area, Presidio of San Francisco, California* (Treadwell & Rollo, 2006).
Concentrations in **BOLD** indicate an exceedance of applicable cleanup levels.
-- cleanup level not established
µg/L - micrograms per liter
PAHs - Polycyclic aromatic hydrocarbons
NA - Not analyzed
ND - Not detected
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in their respective quarterly report.

2 - Groundwater cleanup levels were taken from the *Revised Final Corrective Action Plan for the Commissary/Post Exchange Study Area, Presidio of San Francisco, California* (Treadwell & Rollo, 2006).

All metal results represent dissolved metals, unless indicated as "total" in the left-hand column, for total metal results.

Concentrations in **BOLD** indicate dissolved metals concentrations which exceed applicable cleanup levels. CAP cleanup levels apply only to dissolved concentrations.

-- cleanup level not established

µg/L - micrograms per liter

mg/L - milligrams per liter

NA - Not analyzed

CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.

2 - The concentration of As V was determined by the laboratory by subtracting the As III concentration from the inorganic As concentration. As III has been detected at greater concentrations than inorganic As, due to analytical variability. As V is reported as non-detect when As III is detected at a greater concentration than inorganic As.

3 - Groundwater cleanup levels were taken from the *Revised Final Corrective Action Plan for the Commissary/Post Exchange Study Area, Presidio of San Francisco, California* (Treadwell & Rollo, 2006), which is currently under review by the stakeholders.

µg/L - micrograms per liter
mV - millivolts
NA - Not analyzed

All Third Quarter 2005 arsenic speciation results were qualified as estimated (J) by the laboratory because the samples were received at a temperature slightly higher the require 4 degrees Celsius. Additionally, Third Quarter 2005 As III results from 610GW102 and 610SP02 were qualified with a J- by DataVal because the continuing calibration verification percent difference failed QC limits, which indicates the sample result is biased low. Several other Third Quarter 2005 results were qualified by DataVal with either a (U) or (J) in addition to the (J) qualifier applied by the laboratory. These qualifiers are defined in Table 11 of the main text.

Concentrations in **BOLD** indicate an exceedance of applicable cleanup levels.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Analytical results represent dissolved arsenic, unless indicated as "total" in the left-hand column, for total arsenic results.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

	08/11/03	Not flowing	--	--	Surface
	06/02/03	Not flowing	--	--	Surface

Notes
1 - All depth to water measurements are an average of three measurements recorded in the field.
2 - Seep sampling location was submerged under standing water.
MW- Monitoring well
feet PLLW - feet above Presidio lower low water vertical datum
-- Groundwater level measurements were not collected on a tidal schedule beginning with Fourth Quarter 2003.

LEGEND

- 610GW101 — A1 Zone Groundwater Monitoring Well
- 610SP01 — Surface Water Seep Location
- 637-34 — Adjacent Study Area Well
- Commissary Seeps Interim Source Removal Excavation
- Saltwater Ecological Protection Zone Boundary (RWQCB, 2003). (Areas north and east of boundary lie within zone)
- Approximate 150 ft Buffer Zone
- Area A / Area B Boundary
- Effective Phase 1 Area/ Phase 2 Area Boundary
- Topographic Contour (Contour Interval : 10 ft)
- Approximate Extent of Phase 1 Impacted Soil
- Approximate Extent of Phase 2 Impacted Soil
- 610 — Building and Number

Notes:
The excavation boundary is defined in the Commissary Seeps Interim Removal Action Report (Treadwell & Rollo, 2002a).

Horizontal Datum: NAD 27, CA State Plane Coordinates, Zone 3, feet
Vertical Datum: (topography) North American Vertical Datum, NAVD88

BAKER BEACH DISTURBED AREAS 1 AND 2A
APPENDIX SECTION A-17
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Baker Beach Disturbed Area (BBDA)s 1 and 2A are located along the western coastline of the Presidio, south of the Golden Gate Bridge. The site is bordered by the Golden Gate Bridge Highway and Transportation District to the north, Merchant Road, and Lincoln Boulevard to the east and the Pacific Ocean to the west. BBDAs 1 and 2A are situated immediately west of Batteries Boutelle and Marcus Miller, and north of BBDA 2 (Figure 1). The site elevation ranges from approximately 10 to 250 feet above PLLW.

BBDAs 1 and 2A have been identified as "disturbed areas" where buried waste fill is present (Figure A-17-1). Based on a review of aerial photographs, BBDAs 1 and 2A received fill material intermittently between 1946 and 1973 (MACTEC, 2004). The fill material in BBDAs 1 and 2A is composed primarily of soil and debris fill containing concrete, asphalt, and metal debris (Figure A-17-1).

Groundwater has not been encountered at the site, but freshwater seeps are present at various locations throughout the Coastal Bluffs (MACTEC, 2004). On 21 and 22 April 2005, two piezometers were installed within the fill to monitor freshwater seeps at BBDA 1. The piezometers were designated as BB1PZ100 and BB1PZ101. An ephemeral seep, BB2ASW100, flows seasonally at the toe of the fill at BBDA 2A (A-17-1). Summaries of dissolved oxygen, general chemistry, TPH, and metals, PAH, and VOC results are presented in Table A-17-1 through A-17-4.

Remedial excavation is planned for these areas and is scheduled to begin in early 2007. Monitoring and sampling of the freshwater seeps at BBDAs 1 and 2A will continue until commencement of remedial construction activities. The piezometers will be abandoned prior to the remedial action. If surface water seeps are present following the excavation activities, then sampling points will be installed, if needed, and quarterly monitoring will resume.

2.0 SITE DESCRIPTION AND GEOLOGY

BBDAs 1 and 2A are located in the Coastal Groundwater Basin (Figure 1). Based upon hydrogeologic information from adjacent areas, groundwater may be present in limited areas of the landslide deposit and the weathered serpentinite bedrock formations. Groundwater has not been encountered within the BBDAs 1 and 2A footprints. However, groundwater flow is

assumed to follow the general topographic trend westward toward the Pacific Ocean (Figure A-17-1).

The fill material at the sites is characterized as random mixtures of soil, chert, and serpentinite fragments, debris fill including building debris (red brick, concrete, glass, and wood) and glass, ceramics, and automotive parts (MACTEC, 2004).

The area in the vicinity of BBDAs 1 and 2A is a steeply sloping bluff with a narrow beach at its base. Surface drainage in the area is to the west, toward the Pacific Ocean. Vegetation in the area consists of grasses, shrubs, and trees.

Local geology is predominantly Franciscan Formation overlain by landslide deposits. The Franciscan Formation in the area consists primarily of serpentinite and minor amounts of sandstones, shales, and cherts; the overlaying landslide deposits generally consist of unstratified mixtures of bedrock fragments, sand, silt, and clay (Schlocker, 1974). The thickness of debris fill is estimated to be greater than 3.5 feet in this area. (MACTEC, 2004).

Ephemeral seeps are monitored at two locations at BBDA 1 (BB1PZ100 and BB1PZ101) and at the toe of the fill at BBDA 2A (BB2ASW100) (Figure A-17-1). Historical surface water monitoring data for BBDAs 1 and 2A are presented in the *Draft Remedial Action Plan, Baker Beach Disturbed Areas 1, 1A, 2, and 2A, and Twenty-Seven Other Sites* (RAP3) (MACTEC, 2004). As documented in RAP3, it is anticipated that removal of the fill material could alter the location(s) of the freshwater seep(s) located at BBDAs 1 and 2A.

3.0 REMEDIAL ACTION PLAN

RAP3 is currently being reviewed by the Trust and the NPS and was submitted to the DTSC, RWQCB, and RAB for concurrence prior to public review. Based on the soil analytical results from previous investigations, contaminants of concern (COCs) in soil identified for BBDAs 1 and 2A include pesticides, PAHs, and metals. Additionally, PCBs are a COC at BBDA 1.

Freshwater seep sampling at the BBDAs 1 and 2A will be conducted in accordance with the RAP3 when the RAP3 is finalized. The current analytical suite for freshwater seep samples is to monitor for the soil COCs. The recommended remedial actions for the BBDAs 1 and 2A will be discussed in detail in this report when RAP3 is approved by the stakeholders. Cleanup levels proposed in the RAP3 are based on human health drinking water and freshwater seep cleanup levels and are presented in Tables A-17-2 through A-17-4. Prior to implementing excavation activities proposed in RAP3, existing piezometers BB1PZ100 and BB1PZ101 will abandoned. If freshwater seeps are present, then following completion of excavation activities, monitoring will resume.

4.0 FRESHWATER SEEP MONITORING

BBDAs 1 and 2A were added to the Presidio-Wide Groundwater Monitoring Program beginning in the Second Quarter 2006. Prior to that event, Site monitoring and sampling was performed and reported as part of the RAP3 activities. The First and Second Quarters 2006 were the first and second expanded monitoring events conducted at BBDAs 1 and 2A, since the piezometers were installed in April 2005 and BB1PZ101 was sampled for TPH, PAHs, VOCs, and metals. During the Second Quarter 2006, fresh water seep elevations were measured and sampling was performed within the two piezometers (BB1PZ100 and BB1PZ101) and seep location BB2ASW100. The BB2ASW100 location was dry during the Second Quarter 2006 and therefore no water elevations or samples were collected. The proposed sampling schedules for Second Quarter 2006 are presented in Table 1B.

4.1 Fresh Water Seep-Level Measurements and Interpretation

Fresh water seep elevation measurements were collected on 22 May during the Second Quarter 2006. The fresh water seep elevations at BBDAs 1 and 2A are shown on Figures A-17-1. Water level meters were calibrated on 22 May 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

Fresh water seep elevations at the BBDA 1 during the Second Quarter 2006 ranged from 104.20 to 63.84 feet above PLLW in piezometers BB1PZ100 and BB1PZ101, respectively (Table A-17-5).

Ground water contours and flow directions for BBDAs 1 and 2A could not be calculated due to the lack of groundwater and absence of monitoring locations. However, the apparent seep flow direction across BBDA 1 was observed to be in a westerly direction toward the Pacific Ocean following the general topographic trend.

4.2 Monitoring Well Purging and Sampling

Two piezometers (BB1PZ100 and BB1PZ101) and seep location BB2ASW100 were proposed for sampling during the Second Quarter 2006 (Table 1B) at BBDAs 1 and 2A. Samples were collected during the First Quarter 2006 from the piezometers and seep locations on 1 February 2006 by MACTEC as part of the RAP3 activities. The results from this sample event are included in Tables A-17-1 through A-17-5. During the Second Quarter 2006, BBDA 1 piezometers BB1PZ100 and BB1PZ101 were purged and sampled on 23 May 2006. Seep location BB2ASW100 was dry during the Second Quarter 2006 and therefore, could not be sampled. All samples locations were collected in accordance with methods shown in Table1B and procedures described in the FSP (Treadwell & Rollo, 2001a).

Purging equipment, purging volumes, purge water parameters, and sampling equipment for each sampling location are described in the purge records at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3 Groundwater Analytical Program

All fresh water seep samples were submitted to the project laboratory for the analyses shown in Table 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed for the Second Quarter 2006.

5.0 SURFACE WATER ANALYTICAL RESULTS

During the Second Quarter 2006, seep locations BB1PZ100 and BB1PZ101 were purged and sampled on 23 May 2006. Seep location BB2ASW100 was dry during the Second Quarter 2006 and therefore, could not be purged or sampled. All samples were analyzed for dissolved oxygen, general chemistry parameters, TDS, TPHd, TPHfo, and both dissolved and total metals. Additionally, samples collected during First Quarter 2006 and 27 May 2005 were analyzed for PAHs and VOCs. All analyses were conducted in accordance with the groundwater sampling schedule (Table 1B).

A sufficient amount of data has not yet been collected to evaluate concentration trends and therefore, a discussion of the detected analyte concentrations is provided below.

5.1 Dissolved Oxygen and General Chemistry Results

Dissolved oxygen and general chemistry results are presented in Table A-17-1.

During the Second Quarter 2006, dissolved oxygen was measured at concentrations of 3.51 and 4.13 mg/L within BB1PZ100 and BB1PZ101, respectively. A sufficient amount of dissolved oxygen data has not yet been collected from these locations to develop trends.

General chemistry analytical results are also presented in Table A-17-1. In general, general chemistry parameter concentrations are consistent between the three locations for the First and Second Quarter 2006 samples. Trends will continue to be monitored during future sampling events.

5.2 TPH Results

The analytical results for TPHd and TPHfo, along with the RAP-specified cleanup levels, are presented in Table A-17-2.

During the First Quarter 2006, TPHg was not detected above the laboratory reporting limits in any of the seep locations. TPHd concentrations ranged from 47 µg/L at BB2ASW100 to 830 µg/L at BB1PZ100. TPHfo concentrations ranged from 140 µg/L at BB1PZ101 to 3,100 µg/L at BB1PZ100.

During the Second Quarter 2006, TPHd and TPHfo concentrations at BB1PZ100 and BB1PZ101 ranged between 130 µg/L to120 µg/L, and 630 µg/L to 420 µg/L, respectively. TPHg was not analyzed during the Second Quarter 2006.

5.3 Total and Dissolved Metals Results

Because the First and Second Quarters 2006 were the first and second monitoring events for BB1PZ100 and BB2ASW100 and the second and third events at BB1PZ101, there is not sufficient data to evaluate metal trends. The total and dissolved metals and TDS results for Second Quarter 2006, along with RAP-specified cleanup levels, are presented in Table A-17-3. BBDA 1 seep water samples collected from the piezometer locations during the Second Quarter 2006 were analyzed for both total and dissolved metals.

The majority of dissolved metals concentrations measured during the Second Quarter 2006 are below RAP-specified cleanup levels. Detections above RAP-specified cleanup levels are discussed below.

- During the First Quarter 2006, copper was detected at a concentration of 13 µg/L within the sample collected from BB2ASW100. This exceeds the RAP-specified cleanup of 11.8 µg/L for copper.
- During the First Quarter 2006, mercury was detected at concentrations of 8.5, 8.9, and 1.3 µg/L within the primary and duplicate samples collected from BB1PZ100 and BB2ASW100, respectively. This exceeds the RAP-specified cleanup of 0.012 µg/L for mercury.

RAP-specified cleanup levels apply only to dissolved metals. No metals were detected above RAP-specified cleanup levels during the Second Quarter 2006.

5.4 PAH and VOC Results

During the First Quarter 2006, all three locations were sampled for PAH and VOC analyses. BB1PZ100 and BB1PZ101 samples were also tested for PAHs in May 2005. During the Second Quarter 2006, BB1PZ100 and BB1PZ101 were sampled for PAHs.

During the First Quarter 2006, several PAHs were detected within the primary and duplicate (DUP020106) samples collected from BB1PZ100. Chrysene was reported at concentrations of 0.02 and <0.1 µg/L, respectively. Naphthalene was detected at concentrations of 0.06 and 0.02 µg/L, respectively. Phenanthrene was detected at concentrations of 0.02 and 0.01 µg/L, respectively. Pyrene was detected at concentrations of 0.02 and <0.02 µg/L, respectively.

During the First Quarter 2006, PAHs results in the sample collected from BB1PZ101 were detected at the following concentrations; fluorene at a concentration of 0.06 µg/L; phenanthrene at a concentration of 0.01 µg/L; and pyrene at a concentrations of 0.01. PAH results during the First Quarter 2006 in seep location BB2ASW100 detected: anthracene (0.05 µg/L), benzo(a) anthracene (0.01 µg/L), benzo(b) fluoranthene (0.02 µg/L), chrysene (0.03 µg/L), fluoranthene (0.05 µg/L), fluorene (0.1 µg/L), naphthalene (0.05 µg/L), phenanthrene (0.09 µg/L), and pyrene (0.05 µg/L).

No other PAHs were detected in any of the BBDAs 1 and 2A samples during the First Quarter 2006. All detected concentrations of PAHs were below the proposed RAP3 effective cleanup levels. No PAHs were detected within BB1PZ100 or BB1PZ101 during the Second Quarter 2006.

VOC analytical results during the First Quarter 2006 in the primary and duplicate (DUP020106) samples from BB1PZ100, acetone was detected at concentrations of 1.5 and 0.9 µg/L, respectively. Benzene was detected at concentrations of 0.2 and 0.1 µg/L, respectively. Carbon disulfide was detected at concentrations of 0.1 and 0.1 µg/L, respectively. Methylene chloride was detected at concentrations of 0.3 and 0.2 µg/L, respectively.

During the First Quarter 2006 and 27 May 2005, results of VOC in samples from BB1PZ101, acetone was detected at concentrations of 1 and 0.9 µg/L. Methylene chloride was detected at concentrations of 0.2 and <10 µg/L, respectively. During the First Quarter 2006, VOCs detected in BB2ASW100 included acetone at 2.6 µg/L, carbon disulfide at 0.1 µg/L and methylene chloride (0.6 µg/L). No other VOCs were detected in any of the BBDAs 1 and 2A samples during the First Quarter 2006 and all detected concentrations of VOCs were below the proposed RAP3 effective cleanup levels.

6.0 CONCLUSIONS AND RECOMMENDATIONS

BBDAs 1 and 2A were added to the Presidio-Wide Groundwater Monitoring Program beginning Second Quarter 2006. No groundwater has been encountered at BBDAs 1 and 2A, however, two piezometers (BBDA1PZ100 and BB1PZ101) monitor a fresh water seep at BBDA 1 and one seep location is monitored at BBDA 2A (BB2ASW100).

Due to limited data collected to date, no significant trends were identified during the Second Quarters 2006 at BBDAs 1 and 2A. Future detections and trends will continue to be monitored and evaluated in accordance with the RAP, which is scheduled to be completed in 2007.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2006.
2 - Seep water target effective cleanup levels were taken from *Draft Remedial Action Plan, Baker Beach Disturbed Areas 1, 1A, 2, and 2A, and Twenty-Seven Other Sit*
µg/L - micrograms per liter
NA - not analyzed
-- - not available or applicable
ND - All analytes below reported individual analytical detection limits
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

APPENDIX D
DataVal Data Validation Summary Reports

First Quarter 2006

DataVal, Inc.

RECEIVED
JUN 2 3 2006
TREADWELL & ROLLO

TO: Joshua Graber, Treadwell & Rollo, Inc June 20, 2006

FROM: Donna Breaux, DataVal, Inc. DB 6/20/06 T&R Project No. 2893.04

DATA VALIDATION SUMMARY REPORT FOR THE FIRST QUARTER 2006 GROUNDWATER MONITORING, THE PRESIDIO OF SAN FRANCISCO, CA

PRIMARY LABORATORY: Curtis & Tompkins, Ltd., Berkeley, CA

QC SPLIT SAMPLE LABORATORY: Columbia Analytical Services, Inc., Redding, CA

SAMPLING DATES: March 7 through 24, 2006

Data validation of Level III laboratory data packages was performed according to the project-specific guidelines. These guidelines were outlined in the Presidio-wide Quality Assurance Project Plan, Sampling and Analysis Plan, April, 2001; the U. S. Environmental Protection Agency Contract Laboratory Program National Functional Guidelines for Organic Data Review, October, 1999; and the U. S. Environmental Protection Agency Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, October 2004.

The data were reviewed for holding times, blanks, GC/MS tunes, initial calibrations, continuing calibration verification (CCV) standards, performance evaluation mix (PEM) standards, internal standards, laboratory duplicate samples, laboratory control samples (LCS), surrogate recoveries, matrix spikes (MS), matrix spike duplicates (MSD), ICP interference check standards, ICP serial dilutions and field QC samples.

The following paragraphs highlight the essential findings of the data validation effort on the primary samples:

I. Volatile Organic Compounds (VOCs) by GC/MS (8260B)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Sections C and I.

A. Reporting Limits

The laboratory reporting limits for VOCs in water matrix samples met the project required reporting limits, with the following exceptions:

1. The laboratory reporting limits did not meet the project required reporting limits listed in Table 2-6.8-1 of the QAPP for bromoform, bromomethane, chloroethane, and chloromethane. The laboratory reported 1.0 ug/L for these compounds. The project required reporting limit was 0.5 ug/L.

B. Holding Times

Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries

Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exceptions:

1. Samples with non-detect results and high-failing surrogate recoveries did not require qualification, and were not noted in this report.
2. The percent recoveries for surrogate 1,2-dichloroethane-d4 were outside the 76%-114% project acceptance criteria in samples 231GW17 (185586-025) (123%), 231GW18 (185586-024) (123%), 231GW27 (185586-022) (124%) and 231GW28 (185586-021) (123%). The detected results in these samples were qualified as estimated with a high bias (J+). Qualification was not required for non-detect results.

See Table 2 of this report for a summary of qualifications due to surrogate percent recovery failures.

D. Blanks

Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples, with the following exceptions:

1. Source blank DW031306A (185511-012) had detected levels of chloroform (7 ug/L) and bromodichloromethane (0.7 ug/L). The associated samples were non-detect for chloroform and bromodichloromethane, and qualification was not required.
2. Source blank DW031306B (185511-013) had a detected level of chloroform (3.1 ug/L). The associated samples were non-detect for chloroform, and qualification was not required.

E. Laboratory Control Samples

All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate

All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples.

G. GC/MS Tunes

All QC criteria were met for the GC/MS tunes associated with the project samples.

H. Initial Calibration

Initial calibration criteria were met for all calibration standards associated with the project samples.

I. Continuing Calibration

Continuing calibration criteria were met for all continuing calibration standards associated with the project samples, with the following exceptions:

1. Qualification was not required for samples with non-detect results associated with high-failing continuing calibration standards. Those failures were not noted in this report.
2. The 3/14/06 at 11:08 continuing calibration verification (CCV) standard analyzed on instrument MSVOA09 had bromomethane with a percent difference (%D) less than the +/-25%D acceptance criteria at -28%. The non-detect results for bromomethane in the associated samples were qualified as estimated (UJ).
3. The 3/17/06 at 13:30 CCV standard analyzed on instrument MSVOA08 had bromomethane with a %D less than the +/-25%D acceptance criteria at -47%. The non-detect results for bromomethane in the associated samples were qualified as estimated (UJ).
4. The 3/20/06 at 13:17 CCV standard analyzed on instrument MSVOA08 had bromomethane with a %D less than the +/-25%D acceptance criteria at -28%. The non-detect results for bromomethane in the associated samples were qualified as estimated (UJ).
5. The 3/21/06 at 8:28 CCV standard analyzed on instrument MSVOA05 had bromomethane with a %D less than the +/-25%D acceptance criteria at -44%. The non-detect results for bromomethane in the associated samples were qualified as estimated (UJ).
6. The 3/21/06 at 8:31 CCV standard analyzed on instrument MSVOA09 had bromomethane with a %D less than the +/-25%D acceptance criteria at -46%. The non-detect results for bromomethane in the associated samples were qualified as estimated (UJ).
7. The 3/22/06 at 8:52 CCV standard analyzed on instrument MSVOA05 had bromomethane with a %D less than the +/-25%D acceptance criteria at -48%. The non-detect results for bromomethane in the associated samples were qualified as estimated (UJ).
8. The 3/22/06 at 8:35 CCV standard analyzed on instrument MSVOA09 had bromomethane with a %D less than the +/-25%D acceptance criteria at -54%. The non-detect results for bromomethane in the associated samples were qualified as estimated (UJ).
9. The 3/23/06 at 9:19 CCV standard analyzed on instrument MSVOA09 had bromomethane, acetone and vinyl acetate with %Ds less than the +/-25%D acceptance criteria at -33%, -26% and -29%, respectively. The non-detect results for bromomethane, acetone and vinyl acetate in the associated samples were qualified as estimated (UJ).

See Table 2 of this report for a summary of samples qualified for CCV percent difference failure.

J. Internal Standards

Internal standard areas and retention times met QC acceptance criteria for all project samples.

II. Semi-volatile Organic Compounds (SVOCs) by GC/MS (8270C)

Overall, the data are usable as reported with any added qualifiers. Qualification was required for the reason noted in Section I.

A. Reporting Limits

The laboratory reporting limits for SVOCs in water matrix samples met the project required reporting limits, with the following exception:

1. The laboratory reporting limit did not meet the project required reporting limit listed in Table 2-6.9-1 of the QAPP for 2-nitrophenol. The laboratory reported 20 ug/L for this compound. The project required reporting limit was 10 ug/L.

B. Holding Times

Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries

Surrogate spike recoveries met QC acceptance criteria for all project samples. Samples with non-detect results associated with high-failing surrogate recoveries did not require qualification, and were not noted in this report.

D. Blanks

Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples

All QC criteria were met for the laboratory control samples associated with the project samples. Samples with non-detect results and high-failing laboratory control sample recoveries did not require qualification, and were not noted in this report.

F. Matrix Spike/Matrix Spike Duplicate

A matrix spike and matrix spike duplicate were not analyzed with the project samples for this analysis.

G. GC/MS Tunes

All QC criteria were met for the GC/MS tunes associated with the project samples.

H. Initial Calibration

Initial calibration criteria were met for all calibration standards associated with the project samples.

I. Continuing Calibration

Continuing calibration criteria were met for all calibration standards associated with the project samples, with the following exceptions:

1. Qualification was not required for samples with non-detect results associated with high-failing continuing calibration verification standards (CCVs). Those failures were not noted in this report.
2. The 3/23/06 at 12:02 water matrix continuing calibration verification standard (CCV) analyzed on instrument MSBNA05, had one compound with a percent difference (%D) less than the +/-25%D acceptance criteria: bis(2-chloroisopropyl)ether at -44%. The non-detect result for bis(2-chloroisopropyl)ether in the associated sample was qualified as estimated (UJ).

See Table 2 of this report for a summary of qualifications due to continuing calibration percent difference failure.

J. Internal Standards

Internal standard areas and retention times met QC acceptance criteria for all project samples.

III. N-Nitrosodimethylamine (NDMA) GC/MS (1625C)

Overall, the data are usable as reported with any added qualifiers. Qualification was required for the reason noted in Section C.

A. Reporting Limits

A project required reporting limit for NDMA in water matrix samples was not stated in the QAPP.

B. Holding Times

Technical holding time criteria were met for all project samples.

C. Labeled Compound Recoveries

Labeled compound recoveries met QC acceptance criteria for all project samples, with the following exception:

1. The percent recovery for labeled compound n-nitrosodimethylamine-d6 failed the 25%-175% laboratory acceptance criteria in project sample NKGW04 (185679-004) at 23%. The detected result for n-nitrosodimethylamine in the sample was qualified as estimated (J).

See Table 2 of this report for a summary of qualifications due to labeled compound percent recovery failure.

D. Blanks

Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples, with the following exceptions:

1. Source blanks DW031306A and DW031306B had detected levels of n-nitrosodimethylamine at 4.25 ug/L and 2.7 ug/L, respectively. Project sample association with these blanks could not be established, therefore qualification of sample data was not required.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
A matrix spike and matrix spike duplicate were not analyzed with the project samples for this analysis.

G. GC/MS Tunes
The injection of DFTPP at the start of the analytical sequence could not be verified with the information included in the data package.

H. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

I. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

J. Internal Standards
Internal standard areas met QC acceptance criteria for all project samples. Retention times could not be verified with the information provided in the data package.

IV. Total Petroleum Hydrocarbons (TPH) - Gasoline/Stoddard Solvent (8015B)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limit for TPH-gasoline in water matrix samples met the project required reporting limit. A project required reporting limit was not provided for stoddard solvent in the QAPP.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples. Samples with high-failing surrogate recoveries due to co-elution with high levels of hydrocarbons did not require qualification, and were not noted in this report.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

V. Total Petroleum Hydrocarbons – Diesel/Fuel Oil Range (8015B)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limits for TPH-diesel and TPH-fuel oil in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples. Qualification was not required for samples with non-detect results associated with high-failing continuing calibration standards. Those failures were not noted in this report.

VI. Aromatic Volatiles by Gas Chromatography (GC) (8021B)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limits for benzene, toluene, ethylbenzene, xylenes and methyl t-butyl ether in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples. Samples with one failing surrogate did not require qualification if the alternate surrogate met project acceptance criteria. Those failures were not noted in this report.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples. Data was reported from two columns. CCVs with percent differences that failed criteria on one column did not require qualification of sample results if those results were reported from the column in control. Such failures were not noted in this report.

VII. Organochlorine Pesticides (8081A)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Sections C, H and I.

A. Reporting Limits
The laboratory reporting limits for pesticides in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exceptions:

1. The percent recoveries for surrogate decachlorobiphenyl (DCB) failed the 65%-135% project acceptance criteria in three project samples. The compounds associated with surrogate DCB: alpha-chlordane, 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, dieldrin, endosulfan II, endosulfan sulfate, endrin, endrin ketone, gamma-chlordane, methoxychlor and toxaphene, were qualified as estimated with a low bias (J-/UJ). The following table lists the project samples qualified due to these QC failures.

Project Sample Name	Laboratory Sample ID	DCB % Recovery	TCMX % Recovery
1349MW100	185622-026	64%	92%
LF6GW100	185622-036	47%	75%
LF6GW103	185622-037	59%	73%

See Table 2 of this report for a summary of qualifications due to surrogate percent recovery failures.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples.

G. Performance Evaluation Mix (PEM) Check Standards
All PEM check standards met the project degradation criteria of 20% for endrin and 4,4'-DDT.

H. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples, with the following exceptions:

1. Data was reported from two columns. Initial calibrations with percent relative standard deviations (%RSDs) that failed criteria on one column did not require qualification of sample results if those results were reported from the column in control. Such failures were not noted in this report.
2. The 3/11/06 initial calibration analyzed on instrument GC16, column A, had one compound with a %RSD greater than 20%, 4,4'-DDT at 26%. The non-detected results for 4,4'-DDT in the associated samples were qualified as estimated (UJ). Qualification was not required for results reported from column B.

See Table 2 of this report for a summary of qualifications due to initial calibration percent relative standard deviation failure.

I. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples, with the following exceptions:

1. Qualification was not required for samples with non-detect results associated with high-failing continuing calibration verification standards (CCVs). Those failures were not noted in this report.
2. Data was reported from two columns. CCVs with percent differences (%Ds) that failed criteria on one column did not require qualification of sample results if those results were reported from the column in control. Such failures were not noted in this report.
3. The 3/13/06 at 12:02 water matrix CCV analyzed on instrument GC21, column A, had 4,4'-DDT with a %D less than the +/-15%D acceptance criteria at -17%. The associated samples were non-detect for 4,4'-DDT, and were qualified as estimated (UJ).
4. The 3/16/06 at 00:28 water matrix CCV analyzed on instrument GC21, columns A and B, had 4,4'-DDT with %Ds less than the +/-15%D acceptance criteria at -21% on column A and -17% on column B. The

associated samples were non-detect for 4,4'-DDT, and were qualified as estimated (UJ).

5. The 3/13/06 at 14:09 water matrix CCV analyzed on instrument GC16, column B, had 4,4'-DDT with a %D less than the +/-15%D acceptance criteria at -20%. The associated samples were non-detect for 4,4'-DDT, and were qualified as estimated (UJ).
6. The 3/13/06 at 22:26 water matrix CCV analyzed on instrument GC16, column B, had 4,4'-DDT with a %D less than the +/-15%D acceptance criteria at -16%. The associated samples were non-detect for 4,4'-DDT, and were qualified as estimated (UJ).
7. The 3/28/06 at 23:28 water matrix CCV analyzed on instrument GC16, column B, had 4,4'-DDT and methoxychlor with %Ds less than the +/-15%D acceptance criteria at -18% and -18%. The associated samples were non-detect for 4,4'-DDT and methoxychlor, and were qualified as estimated (UJ).

See Table 2 of this report for a summary of samples qualified for CCV percent difference failure.

VIII. Polychlorinated Biphenyls (8082)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reason noted in Section C.

A. Reporting Limits

The laboratory reporting limits for PCBs in water matrix samples met the project required reporting limits.

B. Holding Times

Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries

Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exceptions:

1. The percent recoveries for surrogate decachlorobiphenyl (DCB) failed the 65%-135% project acceptance criteria in several project samples. The compounds associated with surrogate DCB: PCB-1248, PCB-1254, and PCB-1260, were non-detect and qualified as estimated (UJ). The following table lists the project samples qualified due to these QC failures.

Project Sample Name	Laboratory Sample ID	DCB % Recovery	TCMX % Recovery
LF08GW01	185622-033	40%	84%
LF08GW06	185622-034	40%	84%
LF08GW06RB01	185622-035	39%	92%
LF6GW100	185622-036	32%	72%
LF6GW101	185622-030	39%	83%
LF6GW103	185622-037	37%	73%

See Table 2 of this report for a summary of qualifications due to surrogate percent recovery failures.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples, with the following exceptions:

1. Data was reported from two columns. CCVs with percent differences that failed criteria on one column did not require qualification of sample results if those results were reported from the column in control. Such failures were not noted in this report.
2. Qualification was not required for samples with non-detect results associated with high-failing continuing calibration standards. Those failures were not noted in this report.

IX. Polynuclear Aromatic Hydrocarbons by HPLC (8310)

Overall, the data are usable as reported with any added qualifiers. Qualification was required for the reason noted in Section F.

A. Reporting Limits
The laboratory reporting limits for PAHs in water matrix samples met the project required reporting limits, with the following exceptions:

1. The laboratory reporting limits did not meet the project required reporting limits listed in Table 2-6.12-1 of the QAPP for anthracene and fluoranthene. The laboratory reported 0.5 ug/L for anthracene. The project required reporting limit was 0.2 ug/L. The laboratory reported 0.4 ug/L for fluoranthene. The project required reporting limit was 0.2 ug/L.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exception:
1. The percent recoveries for benzo(a)pyrene were outside the 65%-135% project acceptance criteria in QC samples DAESP03 MS/MSD at 47% and 46%, respectively. The result for benzo(a)pyrene in the parent sample was non-detect and qualified as estimated (UJ). (QC Batch 111260)

See Table 2 of this report for a summary of qualifications due to MS/MSD percent recovery failure.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples. Data was reported from two detectors. CCVs with percent differences that failed criteria on one detector did not require qualification of sample results if those results were reported from the detector in control. Such failures were not noted in this report.

X. Total and Dissolved Metals (6010B/6020A/7470A/SM2340B)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Sections E and G.

A. Reporting Limits
The laboratory reporting limits for metals in water matrix samples met the project required reporting limits listed in Table 2-5.21-1 of the QAPP.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples, with the following exceptions:
1. Equipment blank LF08GW02BRB03 (185622-007) had a detected level of sodium at 1300 ug/L. The associated samples had sodium values greater than five times the blank amount, and qualification was not required.
2. Equipment blank LF08GW06RB01 (185622-035) had a detected level of sodium at 980 ug/L. The associated samples had sodium values greater than five times the blank amount, and qualification was not required.

D. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

E. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exceptions:
1. The percent recovery for aluminum was outside the 75%-125% project acceptance criteria in QC sample 1047MW101 (185381-001) MSD at 128%. The associated samples were non-detect for aluminum and qualification was not required. (QC Batch 111241)
2. The percent recoveries for calcium, magnesium, manganese and sodium were outside the 75%-125% project acceptance criteria in QC samples 231GW10 (185457-009) MS and/or MSD. The amounts of these metals present in the parent sample were greater than four times the amounts spiked and qualification was not required. (QC Batch 111276)
3. The percent recoveries for aluminum and sodium were outside the 75%-125% project acceptance criteria in QC samples DAESP03 (185408-008) MS and/or MSD. The amount of aluminum present in the parent sample was greater than four times the amount spiked and qualification was not required. The sample was diluted 20-fold for sodium analysis and qualification was not required. (QC Batch 111659)
4. The percent recoveries for calcium and manganese were outside the 75%-125% project acceptance criteria in QC samples 600GW101 (185408-002) MS and/or MSD. The amounts of calcium and manganese present in the parent sample were greater than four times the amounts spiked and qualification was not required. (QC Batch 111421)

5. The percent recovery for magnesium was outside the 75%-125% project acceptance criteria in QC sample DAESP03 (185408-008) MS. The sample was diluted 20-fold for magnesium analysis and qualification was not required. (QC Batch 111388)
6. The percent recoveries for calcium, magnesium and sodium were outside the 75%-125% project acceptance criteria in QC samples 1349MW02 (185457-016) MS/MSD. The amounts of these metals present in the parent sample were greater than four times the amounts spiked and qualification was not required. (QC Batch 111436)
7. The percent recoveries for calcium, magnesium and sodium were outside the 75%-125% project acceptance criteria in QC samples 1065PZ6B (185457-027) MS and/or MSD. The amounts of these metals present in the parent sample were greater than four times the amounts spiked and qualification was not required. (QC Batch 111603)
8. The percent recoveries for aluminum (55%) and sodium were outside the 75%-125% project acceptance criteria in QC samples BHWGW01 (185622-001) MS and/or MSD. The amount of sodium present in the parent sample was greater than four times the amount spiked and qualification was not required. The associated samples were non-detect for aluminum and were qualified as estimated (UJ). (QC Batch 111807)
9. The percent recoveries for potassium (66%/74%), calcium, magnesium and sodium were outside the 75%-125% project acceptance criteria in QC samples DAEGW101 (185622-020) MS/MSD. The amounts of calcium, magnesium and sodium present in the parent sample were greater than four times the amounts spiked and qualification was not required. The results for potassium in the associated samples were qualified as estimated with a low bias (J-/UJ). (QC Batch 111808)
10. The percent recovery for calcium was outside the 75%-125% project acceptance criteria in QC sample LF02GW04 (185679-011) MS. The amount of calcium present in the parent sample was greater than four times the amount spiked and qualification was not required. (QC Batch 111849)
11. The percent recoveries for calcium, magnesium, manganese and sodium were outside the 75%-125% project acceptance criteria, and the relative percent difference (RPD) for aluminum was outside the 20% project acceptance criteria in QC samples 600GW107 (185679-009) MS and/or MSD. The amounts of calcium, magnesium, manganese and sodium present in the parent sample were greater than four times the amounts spiked and qualification was not required. The results for aluminum in the associated samples were qualified as estimated (J/UJ). (QC Batch 111850)

See Table 2 of this report for a summary of qualifications due to matrix spike percent recovery failure.

F. ICP Interference Check Standards
All QC criteria were met for the ICP interference check standards associated with the project samples.

G. ICP Serial Dilution
All QC criteria were met for the ICP serial dilutions associated with the project samples, with the following exceptions:

1. The percent difference (%D) failed the 10% project acceptance criteria for calcium in the serial dilution of sample 231GW10 (185457-009) at 11%. The results for calcium in the associated samples were qualified as estimated (J/UJ). (QC Batch 111276)
2. The %Ds failed the 10% project acceptance criteria for barium, iron and potassium in the serial dilution of sample 1349MW02 (185457-016) at 14%, 126% and 25%, respectively. The results for barium, iron and potassium in the associated samples were qualified as estimated (J/UJ). (QC Batch 111436)
3. The %D failed the 10% project acceptance criteria for potassium in the serial dilution of sample 1065PZ6B (185457-027) at 15%. The results for potassium in the associated samples were qualified as estimated (J/UJ). (QC Batch 111603)
4. The %D failed the 10% project acceptance criteria for sodium in the serial dilution of sample BHWGW01 (185622-001) at 11%. The results for sodium in the associated samples were qualified as estimated (J/UJ). (QC Batch 111807)
5. The %D failed the 10% project acceptance criteria for magnesium in the serial dilution of sample DAEGW101 (185622-020) at 13%. The results for magnesium in the associated samples were qualified as estimated (J/UJ). (QC Batch 111808)

See Table 2 of this report for a summary of qualifications due to serial dilution percent difference failure.

H. Initial and Continuing Calibrations
All initial and continuing calibration standards associated with the project samples met QC acceptance criteria. Qualification was not required for samples with non-detect results associated with high-failing continuing calibration standards. Those failures were not noted in this report.

XI. Various General Chemistry Methods

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Sections B, E and F.

A. Reporting Limits
The laboratory reporting limits for the general chemistry methods analyzed met the project required reporting limits listed in the tables of the QAPP, with the following exception:

1. The result for surfactants in sample DAESP03 (185778-005) was reported as non-detect at a ten-fold dilution due to the nature of the sample matrix. The reporting limit was raised by the dilution factor.

B. Holding Times

Technical holding time criteria were met for all project samples, with the following exceptions:

1. Samples 1065PZ2A (185511-010), 1065PZ3A (185511-011), DW031306A (185511-012) and DW031306B (185511-013) were analyzed two days after sampling, but past the 48-hour analysis holding time for nitrate-nitrogen and nitrite-nitrogen. The sample results were qualified as estimated with a low bias (J-/UJ).
2. Sample 610SP01 (185679-020) was analyzed 34 days after sampling for total dissolved solids. This was 27 days past the 7-day analysis holding time. The sample results were qualified as estimated with a low bias (J-).

See Table 2 of this report for a summary of qualifications due to missed analysis holding times.

C. Blanks

Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples, with the following exceptions:

1. Source blank DW031306A (185511-012) had detected levels of alkalinity (250 mg/L) and total dissolved solids (60 mg/L). Source blank DW031306B (185511-013) had a detected level of total dissolved solids at 70 mg/L. Equipment blank HWGW101RB04 (185586-007) had a detected level of alkalinity at 3.2 mg/L. Equipment blank LF08GW06RB01 (185622-035) had detected levels of alkalinity (2.8 mg/L) and total dissolved solids (220 mg/L). Since total dissolved solids and alkalinity are considered physical property measurements, qualification of sample data was not required.

D. Laboratory Control Samples

All QC criteria were met for the laboratory control samples associated with the project samples.

E. Matrix Spike/Matrix Spike Duplicate

All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exceptions:

1. The percent recovery for sulfide failed the 75%-125% project acceptance criteria in QC sample 231GW10 (185457-009) MS at 74%. The results for sulfide in the associated samples were qualified as estimated (J-/UJ). (QC batch 111347)
2. The percent recovery for sulfide failed the 75%-125% project acceptance criteria in QC sample 1065PZ6B (185457-027) MSD at

73%. The results for sulfide in the associated samples were qualified as estimated (J-/UJ). (QC batch 111347)

3. The percent recoveries for sulfide failed the 75%-125% project acceptance criteria in QC samples DW031306B (185511-013) MS/MSD at 53% and 58%, respectively. The results for sulfide in the associated samples were non-detect and qualified as estimated (UJ). It should be noted that the parent sample was a source blank. (QC batch 111450)
4. The percent recoveries for sulfide failed the 75%-125% project acceptance criteria in QC samples 1065PZ7A (185586-015) MS/MSD at 158% and 149%, respectively. The results for sulfide in the associated samples were non-detect and qualification was not required. (QC batch 111556)
5. The percent recoveries for sulfide failed the 75%-125% project acceptance criteria in QC samples LF6GW103 (185622-037) MS/MSD at 0% and 0%. The percent recoveries were less than 30%, which required rejection of non-detected results for sulfide. The detected results for sulfide in the associated samples were qualified as estimated (J-). The non-detect results for sulfide in the associated samples were rejected (R). (QC batch 111599)
6. The percent recoveries for sulfide failed the 75%-125% project acceptance criteria in QC samples 610SP02 (185679-021) MS/MSD at 0% and 0%. The percent recoveries were less than 30%, which required rejection of non-detected results for sulfide. The non-detect results for sulfide in the associated samples were rejected (R). (QC batch 111713)
7. The percent recoveries for surfactants (MBAS) failed the 75%-125% project acceptance criteria in QC samples DAEGW103 (185558-015) MS/MSD at 69% and 59%, respectively. The result for surfactants in the associated sample was non-detect and qualified as estimated (UJ). (QC batch 111376)

See Table 2 of this report for a summary of qualifications due to matrix spike percent recovery failure.

F. Laboratory Duplicate Samples

All QC criteria were met for the laboratory duplicate samples associated with the project samples, with the following exceptions:

1. The relative percent difference (RPD) for total dissolved solids failed the 20% project acceptance criteria in the duplicate of sample 1065PZ7A (185586-015) at 39%. The results for total dissolved solids in the associated samples were qualified as estimated (J). (QC Batch 111576)
2. The RPD for total dissolved solids failed the 20% project acceptance criteria in the duplicate of sample LF08GW02B (185622-003) at 32%. The results for total dissolved solids in the associated samples were qualified as estimated (J). (QC Batch 111628)

See Table 2 of this report for a summary of qualifications due to laboratory duplicate relative percent difference failure.

G. Initial and Continuing Calibrations
All initial and continuing calibration standards associated with the project samples met QC acceptance criteria.

The following paragraphs highlight the essential findings of the data validation effort of the QC split samples:

XII. Volatile Organic Compounds by GC/MS (8260B)
Overall, the data are usable as reported with any added qualifiers. Qualification was required for the reason noted in Section I.

A. Reporting Limits
The laboratory reporting limits for VOCs in water matrix samples met the project required reporting limits, with the following exceptions:
1. The laboratory reporting limits did not meet the project required reporting limits listed in Table 2-6.8-1 of the QAPP for bromoform, bromomethane, chloroethane, and chloromethane. The laboratory reported 1.0 ug/L for these compounds. The project required reporting limit was 0.5 ug/L.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. GC/MS Tunes
All QC criteria were met for the GC/MS tunes associated with the project samples.

H. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

I. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples, with the following exception:
1. The 3/13/06 at 10:21 water matrix CCV analyzed on instrument MSU had bromomethane with a percent difference (%D) less than the +/-25%D acceptance criteria at -36%. The associated samples were non-detect for bromomethane, and were qualified as estimated (UJ).

See Table 2 of this report for a summary of samples qualified for CCV percent difference failure.

J. Internal Standards
Internal standard areas and retention times met QC acceptance criteria for all project samples.

XIII. Total Petroleum Hydrocarbons – TPH-Gasoline/Stoddard Solvent (8015B)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limit for TPH-gasoline in water matrix samples met the project required reporting limit. A project required reporting limit was not provided for stoddard solvent in the QAPP.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

XIV. Total Petroleum Hydrocarbons – TPH-Diesel/Fuel oil (8015B)

Overall, the data are usable as reported with any added qualifiers. Qualification was required for the reason noted in Section H.

A. Reporting Limits
The laboratory reporting limits for TPH-diesel and TPH-fuel oil in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples, with the following exceptions:

1. Qualification was not required for samples with non-detect results associated with high-failing continuing calibration standards. Those failures were not noted in this report.

2. The 4/6/06 at 9:32 continuing calibration verification (CCV) standard analyzed on instrument GCG had TPH-diesel with a percent difference (%D) greater than the +/-15%D acceptance criteria at +19%. The detected results for TPH-diesel in the associated samples were qualified as estimated with a high bias (J+). Qualification was not required for non-detect results.

See Table 2 of this report for a summary of samples qualified for CCV percent difference failure.

I. Compound Identification and Quantification
The laboratory reported a carbon range of C10–C24. The project required carbon range was C12-C24. In addition, the samples were not silica gel cleaned prior to analysis. This procedure is a requirement in the QAPP.

XV. Aromatic Volatiles by GC (8021B)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limits for benzene, toluene, ethylbenzene, xylenes and methyl t-butyl ether in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

XVI. Organochlorine Pesticides (8081A)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Section C.

A. Reporting Limits
The laboratory reporting limits for pesticides in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exceptions:

1. The percent recovery for surrogate decachlorobiphenyl (DCB) failed the 65%-135% project acceptance criteria in sample LF5GW104CL (DH005-005) at 42%. The compounds associated with surrogate DCB: alpha-chlordane, 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, dieldrin, endosulfan II, endosulfan sulfate, endrin, endrin ketone, gamma-chlordane, methoxychlor and toxaphene, were non-detect and qualified as estimated (UJ).
2. The percent recoveries for surrogates DCB and 2,4,5,6-tetrachloro-meta-xylene (TCMX) failed the 65%-135% project acceptance criteria in sample 1349MW102CL (DH005-006) at 28% and 54%, respectively. The percent recovery for surrogate DCB was less than 30%, which required rejection of non-detected results. The compounds associated with surrogate DCB: alpha-chlordane, 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, dieldrin, endosulfan II, endosulfan sulfate, endrin, endrin ketone, gamma-chlordane, methoxychlor and toxaphene, were non-detect and qualified as rejected (R). The compounds associated with surrogate TCMX: alpha-BHC, beta-BHC, delta-BHC, gamma-BHC, aldrin, heptachlor, heptachlor epoxide and endosulfan I, were non-detect and qualified as estimated (UJ).
3. The percent recoveries for surrogates DCB and TCMX failed the 65%-135% project acceptance criteria in sample DAESP03CL (DH009-002) at 21% and 63%, respectively. The percent recovery for surrogate DCB was less than 30%, which required rejection of non-detected results. The compounds associated with surrogate DCB: alpha-chlordane, 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, dieldrin, endosulfan II, endosulfan sulfate, endrin, endrin ketone, gamma-chlordane, methoxychlor and toxaphene, were non-detect and qualified as rejected (R). The compounds associated with surrogate TCMX: alpha-BHC, beta-BHC, delta-BHC, gamma-BHC, aldrin, heptachlor,

heptachlor epoxide and endosulfan I, were non-detect and qualified as estimated (UJ).

See Table 2 of this report for a summary of qualifications due to surrogate percent recovery failures.

D. Blanks

Target analytes were not observed in any laboratory method blanks associated with the project samples.

E. Laboratory Control Samples

All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate

Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Performance Evaluation Mix (PEM) Check Standards

All PEM check standards met the project degradation criteria of 20% for endrin and 4,4'-DDT.

H. Initial Calibration

Initial calibration criteria were met for all calibration standards associated with the project samples.

I. Continuing Calibration

Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

XVII. Polychlorinated Biphenyls (8082)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Section C.

A. Reporting Limits

The laboratory reporting limits for PCBs in water matrix samples met the project required reporting limits.

B. Holding Times

Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries

Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exceptions:

1. The percent recoveries for surrogates decachlorobiphenyl (DCB) and 2,4,5,6-tetrachloro-meta-xylene (TCMX) failed the 65%-135% project acceptance criteria in sample LF4GW103CL (DH005-004) at 36% and 62%, respectively. The compounds associated with surrogate DCB:

PCB-1248, PCB-1254, and PCB-1260, were non-detect and qualified as estimated (UJ). The compounds associated with surrogate TCMX: PCB-1016, PCB-1221, PCB-1232 and PCB-1242, were non-detect and qualified as estimated (UJ).

2. The percent recoveries for surrogates DCB and TCMX failed the 65%-135% project acceptance criteria in sample 1349MW102CL (DH005-006) at 18% and 52%, respectively. The percent recovery for surrogate DCB was less than 30%, which required rejection of non-detected results. The compounds associated with surrogate DCB: PCB-1248, PCB-1254, and PCB-1260, were non-detect and qualified as rejected (R). The compounds associated with surrogate TCMX: PCB-1016, PCB-1221, PCB-1232 and PCB-1242, were non-detect and qualified as estimated (UJ).
3. The percent recovery for surrogate DCB failed the 65%-135% project acceptance criteria in sample DAESP03CL (DH0095-002) at 14%. The percent recovery for surrogate DCB was less than 30%, which required rejection of non-detected results. The compounds associated with surrogate DCB: PCB-1248, PCB-1254, and PCB-1260, were non-detect and qualified as rejected (R).

See Table 2 of this report for a summary of qualifications due to surrogate percent recovery failures.

D. Blanks

Target analytes were not observed in any laboratory method blanks associated with the project samples.

E. Laboratory Control Samples

All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate

Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Initial Calibration

Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration

Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

XVIII. Polynuclear Aromatic Hydrocarbons by HPLC (8310)

Overall, the data are usable as reported with any added qualifiers. Qualification was required for the reason noted in Section C.

A. Reporting Limits
The laboratory reporting limits for PAHs in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exception:

1. The percent recovery for surrogate terphenyl-d14 was outside the 65%-135% project acceptance criteria in sample 1349MW102CL (DH005-006) at 53%. All compounds in the sample were non-detect and qualified as estimated (UJ).

See Table 2 of this report for a summary of qualifications due to surrogate percent recovery failure.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples. Qualification was not required for samples with non-detect results associated with high-failing continuing calibration standards. Those failures were not noted in this report.

XIX. Total and Dissolved Metals (6010B, 6020, 7470A)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Sections B and D.

A. Reporting Limits

The laboratory reporting limits for metals in water matrix samples met the project required reporting limits listed in Tables 2-5.21-1 and 2-5.26-1 of the QAPP.

B. Holding Times

Technical holding time criteria were met for all project samples, with the following exception:

1. The analysis for mercury was performed 15 days past the 28-day analysis holding time in sample DAESP03CL (DH009-002). The result for mercury in the sample was non-detect and qualified as estimated (UJ).

See Table 2 of this report for a summary of qualifications due to missed analysis holding times.

C. Blanks

Target analytes were not observed in any laboratory method blanks associated with the project samples.

D. Laboratory Control Samples

All QC criteria were met for the laboratory control samples and laboratory control sample duplicates associated with the project samples, with the following exceptions:

1. Qualification was not required for samples with non-detect results associated with high-failing laboratory control samples. Those failures were not noted in this report.
2. The percent recoveries for iron were outside the 80%-120% project acceptance criteria in QC samples LCSW-0315/LCSDW-0315 at 122% and 122%, respectively. The detected results for iron in the associated samples were qualified as estimated with a high bias (J+).

See Table 2 of this report for a summary of qualifications due to laboratory control sample percent recovery failure.

E. Matrix Spike/Matrix Spike Duplicate

Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

F. ICP Interference Check Standards

All QC criteria were met for the ICP interference check standards (ICS) associated with the project samples.

G. ICP Serial Dilution

ICP serial dilutions were not analyzed with the project samples.

H. Initial and Continuing Calibrations
All initial and continuing calibration standards associated with the project samples met QC acceptance criteria.

XX. Various General Chemistry Methods

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Sections D and E.

A. Reporting Limits
The laboratory reporting limits for the general chemistry methods analyzed met the project required reporting limits listed in the tables of the QAPP, with the following exceptions:

1. The laboratory reporting limit for fluoride was 1.0 mg/L; the project required reporting limit for this analyte was 0.1 mg/L. The laboratory reporting limit for alkalinity was 10 mg/L; the project required reporting limit for this analyte was 5 mg/L. The laboratory reporting limit for total dissolved solids was 20 mg/L; the project required reporting limit for this analyte was 10 mg/L. The laboratory reporting limit for methylene blue active substances (MBAS) was 0.05 mg/L; the project required reporting limit was 0.025 mg/L.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples, with the following exception:

1. Method blank DH005-MB had a detected level of total dissolved solids at 59 mg/L. With one exception, all associated samples had values for total dissolved solids greater than five times the blank amount. The remaining sample had a reported value for TDS less than five times the blank amount. Since this sample was a QC split sample, the result for TDS was compared to the result from the primary laboratory. Since the two results matched within 3%, data was not qualified for method blank contamination. The high result for TDS in this laboratory method blank result is suspect and could be an error made by the laboratory analyst.

D. Laboratory Control Samples
All QC criteria were met for the laboratory control samples and laboratory control sample duplicates associated with the project samples, with the following exception:

1. The percent recovery for total dissolved solids was outside the 80%-120% project acceptance criteria in QC sample DH005-LCSD at 123%. The detected results for total dissolved solids in the associated samples were qualified as estimated with a high bias (J+).

See Table 2 of this report for a summary of qualifications due to laboratory control sample percent recovery failure.

E. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exception:
1. The percent recovery for sulfide failed the 75%-125% project acceptance criteria in QC sample 1047MW101CL (DH005-001) MS at 73%. The results for sulfide in the associated samples were non-detect and qualified as estimated (UJ). (QC batch K0601866)

See Table 2 of this report for a summary of qualifications due to matrix spike percent recovery failure.

F. Laboratory Duplicate Samples
All QC criteria were met for the laboratory duplicate samples associated with the project samples.

G. Initial and Continuing Calibrations
All initial and continuing calibration standards associated with the project samples met QC acceptance criteria.

SUMMARY
The attached Table 1 lists the samples and analyses included in the data validation effort. The attached Table 2 summarizes the data qualifications of all project samples for each test method included in the data packages.

USABILITY
The quality control criteria were reviewed, and other than those discussed above, all criteria were met and the data are considered acceptable. Rejected sample results (R) are not usable for any purpose. Estimated sample results (J/UJ) are usable only for limited purposes. Based upon the cursory level data validation, all other results are considered valid and usable for all purposes.

VALIDATION QUALIFIERS IDENTIFICATION
The definitions of the following qualifiers are prepared according to the document, "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review," October, 1999.

U The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample. *A minus sign (-) indicates the numerical value has a low bias. A plus sign (+) indicates the numerical value has a high bias.*

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."

NJ The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

FIELD QC

The following paragraphs highlight the essential findings of the field duplicate samples:

Field duplicate precision was evaluated by calculating the relative percent difference (RPD) between detected results in the original sample and the associated duplicate. The control limit used for field duplicates was a relative percent difference less than or equal to 50 percent, or the absolute difference of the two results must be less than the reporting limit for those analytes reported at or near the detection limit. Nineteen samples were collected in duplicate for the First Quarter 2006 sampling event.

Project Sample Primary ID	Laboratory Sample ID	Project Sample Duplicate ID	Laboratory Sample ID
1047MW101	185381-001	DUP0307062A	185381-002
1065PZ5AR	185381-005	DUP0307062B	185381-006
LF4GW103	185381-008	DUP0307063A	185381-009
LF5GW104	185381-011	DUP0307063B	185381-012

The attached Table 3 summarizes the field duplicate sample results. The detected results of the original sample and the associated duplicate sample were compared and the calculated RPDs reported. All RPDs met the 50 percent precision control limit requirement, with the following exceptions:

1. In field duplicates 1349MW102 and DUP0307063C, the absolute difference between the results was greater than the 100 ug/L reporting limit for dissolved aluminum. The original result was non-detect at 100 ug/L and the duplicate result was 260 ug/L. In addition, the relative percent difference (RPD) between the detected results failed the 50% acceptance criteria for dissolved iron at 94%.
2. In field duplicates 600GW108 and DUP0307061B the RPD between the detected results failed the 50% acceptance criteria for dissolved copper at 70%.
3. In field duplicates 231GW21 and DUP0308061A, the absolute difference between the results was greater than the 300 ug/L reporting limit for fuel oil. The original result was non-detect at 300 ug/L and the duplicate result was 5400 ug/L. The RPD between the detected results failed the 50% acceptance criteria for diesel at 119%.
4. In field duplicates LF08GW04 and DUP0316064A, the absolute difference between the results was greater than the 0.01 mg/L reporting limit for cyanide. The original result was non-detect at 0.01 mg/L and the duplicate result was 0.03 mg/L. The RPD between the detected results failed the 50% acceptance criteria for total dissolved solids at 67%.
5. In field duplicates 1213GW101 and DUP0317062A the RPD between the detected results failed the 50% acceptance criteria for benzene at 61%.

The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results in the field duplicate pairs listed above may be due to the sample matrix, sampling or laboratory technique, or method defects. With the exceptions noted above, the results between the field duplicate pairs matched well. Since the effect on the quality of the data is not known, data is not qualified for field duplicate failure.

The following paragraphs highlight the essential findings of the QC split duplicate samples:

Laboratory analytical precision was evaluated by calculating the relative percent differences (RPD) between detected results in the samples and the associated QC split duplicate, which was sent to another laboratory for analysis. The QC split samples were sent to Columbia Analytical Services in Redding, CA. The control limit used for QC split duplicates was a relative percent difference less than or equal to 50 percent, or the absolute difference of the two results must be less than the reporting limit for those analytes that were at or near the detection limit. Twelve samples were collected in duplicate for the First Quarter 2006 sampling event.

Project Sample Primary ID	Laboratory Sample ID	Project Sample Split Duplicate ID	Laboratory Sample ID
1047MW101	185381-001	1047MW101CL	DH005-001
1065PZ5AR	185381-005	1065PZ5ARCL	DH005-002
LF4GW103	185381-008	LF4GW103CL	DH005-004
LF5GW104	185381-011	LF5GW104CL	DH005-005

Project Sample Primary ID	Laboratory Sample ID	Project Sample Split Duplicate ID	Laboratory Sample ID

950GW108	185457-020	950GW108CL	D0600027-001

The attached Table 4 summarizes the QC split duplicate samples. The detected results were compared and the RPDs are reported. All RPDs met the 50 percent precision control limit requirement, with the following exceptions:

1. In QC split duplicates 1065PZ5AR and 1065PZ5ARCL, the RPD between the reported results failed the 50% RPD acceptance criteria for dissolved iron at 56%.
2. In QC split duplicates LF4GW103 and LF4GW103CL, the absolute difference between the results was greater than the 100 ug/L reporting limit for dissolved iron. The original result was 510 ug/L and the duplicate result was non-detect at 100 ug/L.
3. In QC split duplicates 1349MW102 and 1349MW102CL, the absolute difference between the results was greater than the 1 ug/L reporting limit for dissolved copper. The original result was non-detect at 1 ug/L and the duplicate result was 2.7 ug/L.
4. In QC split duplicates 231GW21 and 231GW21CL, the RPD between the reported results failed the 50% RPD acceptance criteria for TPH-diesel at 114%. The absolute difference between the results was greater than the 1 ug/L reporting limit for chloroform. The original result was non-detect at 1 ug/L and the duplicate result was 2.7 ug/L.
5. In QC split duplicates 1260GW102 and 1260GW102CL, the absolute difference between the results was greater than the 50 ug/L reporting limit for TPH-diesel. The original result was non-detect at 50 ug/L and the duplicate result was 120 ug/L.
6. In QC split duplicates 950GW108 and 950GW108CL, the absolute difference between the results was greater than the 50 ug/L reporting limit for TPH-diesel. The original result was non-detect at 50 ug/L and the duplicate result was 120 ug/L.

Data is not qualified for RPD failure in QC split samples because the effect on the quality of the data is not known.

The following paragraphs highlight the essential findings of the field QC blank samples:

Eleven trip blanks, six equipment blanks and two source blanks were analyzed with the project samples. All field QC blanks were non-detect for all methods analyzed, with the following exceptions:

1. Source blank DW031306A (185511-012) had detected levels of chloroform (7 ug/L) and bromodichloromethane (0.7 ug/L). The associated samples were non-detect for chloroform and bromodichloromethane, and qualification was not required.
2. Source blank DW031306B (185511-013) had a detected level of chloroform (3.1 ug/L). The associated samples were non-detect for chloroform, and qualification was not required.

3. Source blanks DW031306A (185511-012) and DW031306B (185511-013) had detected levels of n-nitrosodimethylamine at 4.25 ug/L and 2.7 ug/L, respectively. Project sample association with these blanks could not be established, and qualification was not required.
4. Equipment blank LF08GW02BRB03 (185622-007) had a detected level of sodium at 1300 ug/L. The associated samples had sodium values greater than five times the blank amount, and qualification was not required.
5. Equipment blank LF08GW06RB01 (185622-035) had a detected level of sodium at 980 ug/L. The associated samples had sodium values greater than five times the blank amount, and qualification was not required.
6. Source blank DW031306A (185511-012) had detected levels of alkalinity (250 mg/L) and total dissolved solids (60 mg/L). Qualification was not required for these physical property parameters.
7. Source blank DW031306B (185511-013) had a detected level of total dissolved solids at 70 mg/L. Qualification was not required for this physical property parameter.
8. Equipment blank HWGW101RB04 (185586-007) had a detected level of alkalinity at 3.2 mg/L. The associated samples had alkalinity values greater than five times the blank amount and qualification was not required.
9. Equipment blank LF08GW06RB01 (185622-035) had detected levels of alkalinity (2.8 mg/L) and total dissolved solids (220 mg/L). The associated samples had alkalinity values greater than five times the blank amount. Qualification was not required for these physical property parameters.

W: Water
VOCs: Volatile Organic Compounds
TPH: Total Petroleum Hydrocarbons
FO: Fuel Oil
PCBs: Polychlorinated Biphenyls
PAHs: Polynuclear Aromatic Hydrocarbons
BTEX: Benzene, Toluene, Ethylbenzene, Xylenes
MTBE: Methyl t-butyl ether
FD: Field duplicate of previous numbered sample, (1), (2), etc.
QC: QC split duplicate of previous numbered sample, (1), (2), etc.

General Chemistry Parameters

(1) Total Dissolved Solids (160.1)
(2) Alkalinity (310.1)
(3) Anions (300.0)
(4) Fluoride (340.2)
(5) Nitrate-N (353.2)
(6) Nitrate/Nitrite-N (353.2)
(7) Hardness (SM 2340B)
(8) Cyanide (335.2)
(9) Surfactants (425.1)
(10) Oil & Grease (1664A)
(11) Phenolics (420.1)
(12) Sulfide (376.2)
(13) Total Organic Carbon (415.2)
(14) pH (SW9040B)

*Units for oganic and metals analyses are ug/L; units for general chemistry analyses are mg/L.
RL: Reporting limit
VOCs: Volatile Organic Compounds
PCBs: Polychlorinated Biphenyls
PAHs: Polynuclear Aromatic Hydrocarbons
ND: Not detected
NC: Not calculated. The absolute difference between the sample result and the duplicate sample result is less than the reporting limit.
N/A: Not analyzed
NA: Not applicable. Calculation of the relative percent difference between the sample result and the duplicate sample result is not applicable.

950GW108	185457-020	Water	Gasoline C7-C12	ND	950GW108CL	D0600027-001	ND	NA
950GW108	185457-020	Water	Diesel C12-C24 *	ND< 50	950GW108CL	D0600027-001	120	**> +/- RL**
950GW108	185457-020	Water	Fuel oil C24-C36	ND	950GW108CL	D0600027-001	ND	NA

*Units for oganic and metals analyses are ug/L; units for general chemistry analyses are mg/L.
RL: Reporting limit
VOCs: Volatile Organic Compounds
PCBs: Polychlorinated Biphenyls
PAHs: Polynuclear Aromatic Hydrocarbons
ND: Not detected
NC: Not calculated. The absolute difference between the sample result and the duplicate sample result is less than the reporting limit.
N/A: Not analyzed
NA: Not applicable. Calculation of the relative percent difference between the sample result and the duplicate sample result is not applicable.
* CAS Laboratory reported Diesel C10-C24.

Second Quarter 2006

DataVal, Inc.

RECEIVED
AUG 2 3 2006
TREADWELL & ROLLO

TO: Joshua Graber, Treadwell & Rollo, Inc. August 18, 2006

FROM: Donna Breaux, DataVal, Inc. DB 8/21/06 T&R Project No. 2893.04

DATA VALIDATION SUMMARY REPORT FOR THE SECOND QUARTER 2006 GROUNDWATER MONITORING, THE PRESIDIO OF SAN FRANCISCO, CA

PRIMARY LABORATORY: Curtis & Tompkins, Ltd., Berkeley, CA

QC SPLIT SAMPLE LABORATORY: Columbia Analytical Services, Inc., Redding, CA

SAMPLING DATES: May 23, 24, 25 and 30, 2006

Data validation of Level III laboratory data packages was performed according to the project-specific guidelines. These guidelines were outlined in the Presidio-wide Quality Assurance Project Plan, Sampling and Analysis Plan, April, 2001; the U. S. Environmental Protection Agency Contract Laboratory Program National Functional Guidelines for Organic Data Review, October, 1999; and the U. S. Environmental Protection Agency Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, October 2004.

The data were reviewed for holding times, blanks, GC/MS tunes, initial calibrations, continuing calibration verification (CCV) standards, performance evaluation mix (PEM) standards, internal standards, laboratory duplicate samples, laboratory control samples (LCS), surrogate recoveries, matrix spikes (MS), matrix spike duplicates (MSD), ICP interference check standards, ICP serial dilutions, and field QC samples (field duplicates and field QC blanks).

The following paragraphs highlight the essential findings of the data validation effort on the primary samples:

I. **Volatile Organic Compounds by GC/MS (8260B)**
Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limits for VOCs in water matrix samples met the project required reporting limits, with the following exceptions:
1. The laboratory reporting limits did not meet the project required reporting limits listed in Table 2-6.8-1 of the QAPP for bromoform, bromomethane, chloroethane, and chloromethane. The laboratory reported 1.0 ug/L for these compounds. The project required reporting limit was 0.5 ug/L.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples.

G. GC/MS Tunes
All QC criteria were met for the GC/MS tunes associated with the project samples.

H. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

I. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

J. Internal Standards
Internal standard areas and retention times met QC acceptance criteria for all project samples.

II. Total Petroleum Hydrocarbons - Gasoline Range/Stoddard Solvent (8015B)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limit for TPH-gasoline in water matrix samples met the project required reporting limit. A project required reporting limit was not provided for stoddard solvent in the project QAPP.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

III. Total Petroleum Hydrocarbons – Diesel/Fuel Oil Range (8015B)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limits for TPH-diesel and TPH-fuel oil in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples. Qualification was not required for samples with non-detect results which were associated with high-failing continuing calibration standards. Such failures were not noted in this report.

IV. Aromatic Volatiles by GC (8021B)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limits for benzene, toluene, ethylbenzene, xylenes and methyl t-butyl ether in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples. Data was reported from two columns. Continuing calibration standards with percent differences that failed criteria on one column did not result in sample qualification if the results were reported from the column in control. Such failures were not noted in this report.

V. Organochlorine Pesticides (8081A)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Section I.

A. Reporting Limits
The laboratory reporting limits for pesticides in water matrix samples met the project required reporting limits, with the following exceptions:
1. The results for all pesticides in sample BB1PZ101 (187020-014) were reported at a five-fold dilution due to the nature of the sample matrix. The reporting limits were raised by the dilution factor, and the sample results were non-detect for all target analytes.
2. The results for various pesticides in samples 1349MW100 (187065-012) and DUP0524063A (187065-013) were reported as non-detected at five-fold or ten-fold dilutions due to the nature of the sample matrices. The reporting limits were raised by the dilution factors.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples. Samples with failing surrogate recoveries which required dilutions of five-fold or greater did not require qualification and were not noted in this report.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples.

G. Performance Evaluation Mix (PEM) Check Standards
All PEM check standards met the project degradation criteria of 20% for endrin and 4,4'-DDT.

H. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

I. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples, with the following exceptions:

1. Data was reported from two columns. Continuing calibration verification (CCV) standards with percent differences (%Ds) that failed criteria on one column did not require qualification of sample results if those results were reported from the column in control. Such failures were not noted in this report.
2. The 5/30/06 at 22:38 water matrix CCV analyzed on instrument GC23, channel B, had delta-BHC with a %D less than the +/-15%D acceptance criteria at -17%. The associated samples were non-detect for delta-BHC, and qualified as estimated (UJ).
3. The 6/1/06 at 12:08 water matrix CCV analyzed on instrument GC23, channel A, had beta-BHC, delta-BHC and 4,4'-DDE with %Ds less than the +/-15%D acceptance criteria at -19%, -17% and -27%, respectively. The associated sample was non-detect for these compounds, and qualified as estimated (UJ).
4. The 6/1/06 at 19:33 water matrix CCV analyzed on instrument GC23, channel A, had 4,4'-DDE with a %D less than the +/-15%D acceptance criteria at -17%. The associated sample was non-detect for 4,4'-DDE and qualified as estimated (UJ).

See Table 2 of this report for a summary of samples qualified for continuing calibration verification standard percent difference failure.

VI. Polychlorinated Biphenyls (8082)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limits for PCBs in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples, with the following exception:
1. The percent recoveries for PCB-1016 and PCB-1260 were outside the 65%-135% project acceptance criteria in QC samples QC341529 LCS/ QC341530 LCSD at 137%/140% and 141%/142%, respectively. The associated sample was non-detect for PCB-1016 and PCB-1260, and qualification for LCS percent recovery failure was not required. (QC Batch 113812)

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples. Qualification was not required for samples with non-detect results associated with high-failing continuing calibration standards. Those failures were not noted in this report.

VII. Polynuclear Aromatic Hydrocarbons by HPLC (8310)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limits for PAHs in water matrix samples met the project required reporting limits, with the following exceptions:
1. The laboratory reporting limits did not meet the project required reporting limits listed in Table 2-6.12-1 of the QAPP for anthracene and fluoranthene. The laboratory reported 0.5 ug/L for anthracene. The project required reporting limit was 0.2 ug/L. The laboratory reported 0.4 ug/L for fluoranthene. The project required reporting limit was 0.2 ug/L.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exception:
1. The percent recoveries for benzo(a)pyrene were outside the 65%-135% project acceptance criteria in QC samples 187086-001 MS/MSD. The parent sample was associated with a site unrelated to the project site, and qualification of project samples was not required. (QC batch 113988)

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

VIII. Metals (6010B/6020A/7470A)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Sections C and E.

A. Reporting Limits
The laboratory reporting limits for metals in water matrix samples met the project required reporting limits listed in Table 2-5.21-1 of the QAPP.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples, with the following exceptions:

1. Source blank DW053006B (187137-001) had a detected level of calcium at 2000 ug/L. Project sample association with this blank could not be established, and qualification was not required.
2. Source blank DW052506A (187112-013) had detected levels of calcium (3600 ug/L) and magnesium (910 ug/L). The associated samples had magnesium values greater than five times the blank amount, and qualification was not required. The results for calcium in the associated samples were changed to non-detect (U) if those values were less than five times the blank amount.

See Table 2 of this report for a summary of qualifications due to blank contamination.

D. Laboratory Control Samples

All QC criteria were met for the laboratory control samples associated with the project samples.

E. Matrix Spike/Matrix Spike Duplicate

All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exceptions:

1. The percent recoveries for calcium, manganese and sodium were outside the 75%-125% project acceptance criteria in QC samples 600GW101 MS and/or MSD. The amounts of these metals present in the parent sample were greater than four times the amounts spiked and qualification was not required. (QC Batch 113955)
2. The percent recoveries for aluminum (62%/48%) and magnesium (74%) were outside the 75%-125% project acceptance criteria and the relative percent difference (RPD) for aluminum was outside the 20% project acceptance criteria in QC samples 1065MW9B MS and/or MSD. The amount of magnesium present in the parent sample was greater than four times the amount spiked and qualification was not required. The results for aluminum in the associated samples were non-detect and qualified as estimated (UJ) for matrix spike recovery failure and RPD failure. (QC Batch 113957)
3. The percent recoveries for sodium were outside the 75%-125% project acceptance criteria in QC samples 1065PZ1A MS/MSD. The amount of sodium present in the parent sample was greater than four times the amount spiked and qualification was not required. (QC Batch 114296)

See Table 2 of this report for a summary of qualifications due to matrix spike percent recovery failure and relative percent difference failure.

F. ICP Interference Check Standards

All QC criteria were met for the ICP interference check standards associated with the project samples.

G. ICP Serial Dilution

All QC criteria were met for the ICP serial dilutions associated with the project samples.

H. Initial and Continuing Calibrations
All initial and continuing calibration standards associated with the project samples met QC acceptance criteria.

IX. Various General Chemistry Methods

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reason noted in Section E.

A. Reporting Limits
The laboratory reporting limits for the general chemistry methods analyzed met the project required reporting limits listed in the QAPP, with the following exceptions:
1. Samples 1349MW100 (187065-012) and DUP0524063A (187065-013) were analyzed for nitrite-nitrogen at 2-fold dilutions. The reporting limits were raised by the dilution factors and the results for nitrite-nitrogen were non-detect at the raised reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples, with the following exceptions:
1. Source blank DW052506A (187112-013) had detected levels of alkalinity (8.9 mg/L), chloride (0.26 mg/L), sulfate (4.9 mg/L) and total dissolved solids (5600 mg/L). The associated samples had alkalinity, chloride and sulfate values greater than five times the blank amounts and qualification was not required. Qualification was not required for the physical property parameter total dissolved solids.
2. Source blank DW053006B (187137-001) had detected levels of alkalinity (4.0 mg/L), sulfate (1.4 mg/L) and total dissolved solids (60 mg/L). Project sample association with this blank could not be established, and qualification was not required.

D. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

E. Matrix Spike/Matrix Spike Duplicate
All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exception:
1. The percent recoveries for sulfide failed the 75%-125% project acceptance criteria in QC samples DUP0524063B at 0%/0%. The percent recoveries were less than 30%, which required rejection of non-detected results for sulfide. The detected results for sulfide in the

associated samples were qualified as estimated with a low bias (J-). The non-detect results for sulfide in the associated samples were qualified as rejected (R). (QC batch 113958)

See Table 2 of this report for a summary of qualifications due to matrix spike percent recovery failure.

F. Laboratory Duplicate Samples
All QC criteria were met for the laboratory duplicate samples associated with the project samples.

G. Initial and Continuing Calibrations
All initial and continuing calibration standards associated with the project samples met QC acceptance criteria.

The following paragraphs highlight the essential findings of the data validation effort of the QC split samples:

X. Volatile Organic Compounds by GC/MS (8260B)
Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limits for VOCs in water matrix samples met the project required reporting limits, with the following exceptions:

1. The laboratory reporting limits did not meet the project required reporting limits listed in Table 2-6.8-1 of the QAPP for bromoform, bromomethane, chloroethane, and chloromethane. The laboratory reported 1.0 ug/L for these compounds. The project required reporting limit was 0.5 ug/L.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples. Target analytes were not observed in any field QC blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. GC/MS Tunes
All QC criteria were met for the GC/MS tunes associated with the project samples.

H. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

I. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

J. Internal Standards
Internal standard areas and retention times met QC acceptance criteria for all project samples.

XI. Total Petroleum Hydrocarbons (TPH) - Gasoline Range (8015B)

Overall, the data are usable as reported. Qualification was not required.

A. Reporting Limits
The laboratory reporting limit for TPH-gasoline in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

XII. Total Petroleum Hydrocarbons – Diesel/Fuel Oil Range (8015B)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reason noted in Section C.

A. Reporting Limits
The laboratory reporting limits for TPH-diesel and TPH-fuel oil in water matrix samples met the project required reporting limit.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exception:

1. The percent recoveries for surrogates octacosane and triacontane were outside the 65%-135% project acceptance criteria in sample 1065MW9ACL (D0600543-003) at 60% and 61%, respectively. The results for TPH-diesel and TPH-fuel oil were non-detect and qualified as estimated (UJ).

See Table 2 of this report for a summary of qualifications due to surrogate percent recovery failures.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

XIII. Organochlorine Pesticides (8081A)

Overall, the data are usable as reported with any added qualifiers. Qualification was required for the reason noted in Section C.

A. Reporting Limits
The laboratory reporting limits for pesticides in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exception:

1. The percent recovery for surrogate decachlorobiphenyl (DCB) failed the 65%-135% project acceptance criteria in sample 1349MW100CL (D0600543-002) at 43%. The compounds associated with surrogate DCB: alpha-chlordane, 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, dieldrin, endosulfan II, endosulfan sulfate, endrin, endrin ketone, gamma-chlordane, methoxychlor and toxaphene, were non-detect and qualified as estimated (UJ).

See Table 2 of this report for a summary of qualifications due to surrogate percent recovery failure.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Performance Evaluation Mix (PEM) Check Standards
All PEM check standards met the project degradation criteria of 20% for endrin and 4,4'-DDT.

H. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

I. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

XIV. Polynuclear Aromatic Hydrocarbons by HPLC (8310)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Section C.

A. Reporting Limits
The laboratory reporting limits for PAHs in water matrix samples met the project required reporting limits.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Surrogate Recoveries
Surrogate spike recoveries met QC acceptance criteria for all project samples, with the following exceptions:

1. The percent recovery for surrogate terphenyl-d14 was outside the 65%-135% project acceptance criteria in sample 1213GW101CL (D0600543-001) at 62%. All compounds in the sample were non-detect and qualified as estimated (UJ).
2. The percent recovery for surrogate terphenyl-d14 was outside the 65%-135% project acceptance criteria in sample 1349MW100CL (D0600543-002) at 42%. All compounds in the sample were qualified as estimated with a low bias (J-/UJ).

See Table 2 of this report for a summary of qualifications due to surrogate percent recovery failure.

D. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples.

E. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples.

F. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

G. Initial Calibration
Initial calibration criteria were met for all calibration standards associated with the project samples.

H. Continuing Calibration
Continuing calibration criteria were met for all continuing calibration standards associated with the project samples.

XV. Metals (6010B, 6020, 7470A)

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reason noted in Section D.

A. Reporting Limits
The laboratory reporting limits for metals in water matrix samples met the project required reporting limits listed in Tables 2-5.21-1 and 2-5.26-1 of the QAPP, with the following exception:
1. The result for beryllium in sample 1349MW100CL (D0600543-002) was reported as non-detect at a ten-fold dilution due to the nature of the sample matrix. The reporting limit was raised by the dilution factor.

B. Holding Times
Technical holding time criteria were met for all project samples.

C. Blanks
Target analytes were not observed in any laboratory method blanks associated with the project samples.

D. Laboratory Control Samples
All QC criteria were met for the laboratory control samples associated with the project samples, with the following exception:
1. The percent recovery for iron was outside the 80%-120% project acceptance criteria in QC sample LCSW-0602 at 121%. The detected results for iron in the associated samples were qualified as estimated with a high bias (J+).

See Table 2 of this report for a summary of qualifications due to laboratory control sample percent recovery failure.

E. Matrix Spike/Matrix Spike Duplicate
Matrix spikes and matrix spike duplicates were not analyzed with the project samples for this analysis.

F. ICP Interference Check Standards
All QC criteria were met for the ICP interference check standards (ICS) associated with the project samples.

G. ICP Serial Dilution
ICP serial dilutions were not analyzed with the project samples.

H. Initial and Continuing Calibrations
All initial and continuing calibration standards associated with the project samples met QC acceptance criteria.

XVI. Various General Chemistry Methods

Overall, the data are usable as reported with any added qualifiers. Qualifications were required for the reasons noted in Sections B and E.

A. Reporting Limits

The laboratory reporting limits for the general chemistry methods analyzed met the project required reporting limits listed in the associated tables of the QAPP, with the following exceptions:

1. The laboratory reporting limit for fluoride was 1.0 mg/L; the project required reporting limit for this analyte was 0.1 mg/L. The laboratory reporting limit for alkalinity was 10 mg/L; the project required reporting limit for this analyte was 5 mg/L. The laboratory reporting limit for total dissolved solids was 20 mg/L; the project required reporting limit for this analyte was 10 mg/L.

B. Holding Times

Technical holding time criteria were met for all project samples, with the following exceptions:

1. Samples 1213GW101CL (D0600543-001), 1349MW100CL (D0600543-002) and 1065MW9ACL (D0600543-003) were analyzed for nitrite-nitrogen four to six hours past the 48-hour analysis holding time. The sample results were qualified as estimated (J/UJ).

See Table 2 of this report for a summary of qualifications due to missed analysis holding times.

C. Blanks

Target analytes were not observed in any laboratory method blanks associated with the project samples.

D. Laboratory Control Samples

All QC criteria were met for the laboratory control samples and laboratory control sample duplicates associated with the project samples.

E. Matrix Spike/Matrix Spike Duplicate

All QC criteria were met for the matrix spikes and matrix spike duplicates associated with the project samples, with the following exception:

1. The percent recoveries for sulfide failed the 75%-125% project acceptance criteria in QC samples 1065MW9ACL (D0600543-003) MS/MSD at 26%/25%. The detected result for sulfide in the associated sample was qualified as estimated with a low bias (J-). (QC batch D0600543)

See Table 2 of this report for a summary of qualifications due to matrix spike percent recovery failure.

F. Laboratory Duplicate Samples
All QC criteria were met for the laboratory duplicate samples associated with the project samples.

G. Initial and Continuing Calibrations
All initial and continuing calibration standards associated with the project samples met QC acceptance criteria.

SUMMARY

The attached Table 1 lists the samples and analyses included in the data validation effort. The attached Table 2 summarizes the data qualifications of all project samples for each test method included in the data packages.

USABILITY

The quality control criteria were reviewed, and other than those discussed above, all criteria were met and the data are considered acceptable. Rejected sample results (R) are not usable for any purpose. Estimated sample results (J/UJ) are usable only for limited purposes. Based upon the cursory level data validation, all other results are considered valid and usable for all purposes.

VALIDATION QUALIFIERS IDENTIFICATION

The definitions of the following qualifiers are prepared according to the document, "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review," October, 1999.

U The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample. *A minus sign (-) indicates the numerical value has a low bias. A plus sign (+) indicates the numerical value has a high bias.*

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."

NJ The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

FIELD QC

The following paragraphs highlight the essential findings of the field duplicate samples:

Field duplicate precision was evaluated by calculating the relative percent difference (RPD) between detected results in the original sample and the associated duplicate. The control limit used for field duplicates was a relative percent difference less than or equal to 50 percent, or the absolute difference of the two results must be less than the reporting limit for those analytes that were at or near the detection limit. Six samples were collected in duplicate for the Second Quarter 2006 sampling event.

Project Sample Primary ID	Laboratory Sample ID	Project Sample Duplicate ID	Laboratory Sample ID
610GW103	187020-007	DUP0523061A	187020-008
BB3GW100	187020-009	DUP0523063A	187020-010
1213GW101	187065-009	DUP-05242006	187065-011
1349MW100	187065-012	DUP0524063A	187065-013
1065MW9A	187065-016	DUP0524063B	187065-017
BHWGW01	187112-006	DUP0525063A	187112-007

The attached Table 3 summarizes the field duplicate sample results. The detected results of the original sample and the associated duplicate sample were compared and the calculated RPDs reported. All RPDs met the 50 percent precision control limit requirement, with the following exceptions:

1. In field duplicates 610GW103 and DUP0523061A, the relative percent difference (RPD) between the detected results failed the 50% acceptance criteria for alkalinity at 57%.
2. In field duplicates 1213GW101 and DUP-05242006, the RPD between the detected results failed the 50% acceptance criteria for benzene (120%), TPH-gasoline (69%) and dissolved chromium (81%); and the absolute differences between the results were greater than the reporting limits for ethylbenzene and dissolved manganese. The original result for ethylbenzene was non-detect at 0.5 ug/L and the duplicate result was 2.7 ug/L. The original result for dissolved manganese was non-detect at 10 ug/L and the duplicate result was 29 ug/L.
3. In field duplicates 1349MW100 and DUP0524063A, the absolute difference between the results was greater than the 0.2 ug/L reporting limit for alpha-chlordane. The original result was non-detect at 0.2 ug/L and the duplicate result was 0.8 ug/L.

The analysis of field duplicate samples is a measure of both field and analytical precision. The imprecision in the results in the field duplicate pairs listed above may be due to the sample matrix, sampling or laboratory technique, or method defects. With the exceptions noted above, the results between the field duplicate pairs matched well. Since the effect on the quality of the data is not known, data is not qualified for field duplicate failure.

The following paragraphs highlight the essential findings of the QC split duplicate samples:

Laboratory analytical precision was evaluated by calculating the relative percent differences (RPD) between detected results in the samples and the associated QC split duplicate, which was sent to another laboratory for analysis. The QC split samples were sent to Columbia Analytical Services in Redding, CA. The control limit used for QC split duplicates was a relative percent difference less than or equal to 50 percent, or the absolute difference of the two results must be less than the reporting limit for those analytes that were at or near the detection limit. Four samples were collected in duplicate for the Second Quarter 2006 sampling event.

Project Sample Primary ID	Laboratory Sample ID	Project Sample Split Duplicate ID	Laboratory Sample ID
1213GW101	187065-009	1213GW101CL	D0600543-001
1349MW100	187065-012	1349MW100CL	D0600543-002
1065MW9A	187065-016	1065MW9ACL	D0600543-003
BHWGW01	187112-006	BHWGW01CL	D0600543-004

The attached Table 4 summarizes the QC split duplicate samples. The detected results were compared and the calculated RPDs reported. All RPDs met the 50 percent precision control limit requirement, with the following exceptions:

1. In QC split duplicates 1213GW101 and 1213GW101CL, the absolute difference between the results was greater than the 1 ug/L reporting limit for dissolved copper. The original result was non-detect at 1 ug/L and the duplicate result was 3 ug/L.
2. In QC split duplicates 1349MW100 and 1349MW100CL, the relative percent difference (RPD) between the reported results failed the 50% RPD acceptance criteria for TPH-gasoline (65%), fluorene (61%), fluoranthene (123%) and benzo(a)anthracene (-125%); and the absolute differences between the results were greater than the reporting limits for heptachlor epoxide, 4,4'-DDT and dissolved copper. The original result for heptachlor epoxide was 0.4 ug/L and the duplicate result was non-detect at 0.05 ug/L. The original result for 4,4'-DDT was 0.8 ug/L and the duplicate result was non-detect at 0.1 ug/L. The original result for dissolved copper was non-detect at 1 ug/L and the duplicate result was 4.3 ug/L.
3. In QC split duplicates 1065MW9A and 1065MW9A CL, the absolute difference between the results was greater than the 0.04 mg/L reporting limit for sulfide. The original result was non-detect at 0.04 mg/L and the duplicate result was 0.17 mg/L.
4. In QC split duplicates BHWGW01 and BHWGW01CL, the absolute difference between the results was greater than the 1 ug/L reporting limit for dissolved copper. The original result was non-detect at 1 ug/L and the duplicate result was 2.3 ug/L.

Data is not qualified due to RPD failure of QC split samples because the effect on the quality of the data is not known.

The following paragraphs highlight the essential findings of the field QC blank samples:

Three trip blanks, one equipment blank and two source blanks were analyzed with the project samples. All field QC blanks were non-detect for all methods analyzed, with the following exceptions:

1. Source blank DW053006B (187137-001) had a detected level of calcium at 2000 ug/L. Project sample association with this blank could not be established, and qualification was not required.
2. Source blank DW052506A (187112-013) had detected levels of calcium (3600 ug/L) and magnesium (910 ug/L). The associated samples had magnesium values greater than five times the blank amount, and qualification was not required. The results for calcium in the associated samples were changed to non-detect (U) if those values were less than five times the blank amount.
3. Source blank DW052506A (187112-013) had detected levels of alkalinity (8.9 mg/L), chloride (0.26 mg/L), sulfate (4.9 mg/L) and total dissolved solids (5600 mg/L). The associated samples had alkalinity, chloride and sulfate values greater than five times the blank amounts and qualification was not required. Qualification was not required for the physical property parameter total dissolved solids.
4. Source blank DW053006B (187137-001) had detected levels of alkalinity (4 mg/L), sulfate (1.4 mg/L) and total dissolved solids (60 mg/L). Project sample association with this blank could not be established, and qualification was not required.

*Units for oganic and metals analyses are ug/L; units for general chemistry analyses are mg/L.
RL: Reporting limit
VOCs: Volatile Organic Compounds
PCBs: Polychlorinated Biphenyls
PAHs: Polynuclear Aromatic Hydrocarbons
ND: Not detected
NC: Not calculated. The absolute difference between the sample result and the duplicate sample result is less than the reporting limit.
N/A: Not analyzed
NA: Not applicable. Calculation of the relative percent difference between the sample result and the duplicate sample result is not applicable.

*Units for oganic and metals analyses are ug/L; units for general chemistry analyses are mg/L.
RL: Reporting limit
VOCs: Volatile Organic Compounds
PCBs: Polychlorinated Biphenyls
PAHs: Polynuclear Aromatic Hydrocarbons
ND: Not detected
NC: Not calculated. The absolute difference between the sample result and the duplicate sample result is less than the reporting limit.
N/A: Not analyzed
NA: Not applicable. Calculation of the relative percent difference between the sample result and the duplicate sample result is not applicable.

CASE NARRATIVE

Laboratory number:	**185381**
Client:	**Treadwell & Rollo**
Project:	**2893.04.51**
Location:	**Presidio**
Request Date:	**03/08/06**
Samples Received:	**03/08/06**

This hardcopy data package contains sample and QC results for twenty one water samples, requested for the above referenced project on 03/08/06. The samples were received cold and intact.

TPH-Purgeables and/or BTXE by GC (EPA 8015B and EPA 8021B):
High surrogate recoveries were observed for bromofluorobenzene (FID) and bromofluorobenzene (PID) in 1065MW11B (lab # 185381-007); the corresponding trifluorotoluene (FID) surrogate recovery was within limits. No other analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B):
High response was observed for diesel C12-C24 in the CCV analyzed 03/18/06 14:01; this analyte was not detected at or above the RL in the associated samples. No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
No analytical problems were encountered.

Pesticides (EPA 8081A):
High response was observed for methoxychlor in the ICV analyzed 03/03/06 19:07; average ICV drift met method requirements, and this analyte was not detected at or above the RL in the associated samples. Low response was observed for 4,4'-DDT in the CCV analyzed 03/13/06 12:02; average CCV drift met method requirements. No other analytical problems were encountered.

Polychlorinated Biphenyls (PCBs) (EPA 8082):
No analytical problems were encountered.

Polynuclear Aromatics by HPLC (EPA 8310):
No analytical problems were encountered.

Metals (EPA 6020):
High response was observed for aluminum in the CCV analyzed 03/22/06 20:26; this analyte was not detected at or above the RL in the associated samples. High recovery was observed for aluminum in the MSD of 1047MW101 (lab # 185381-001); the BS/BSD were within limits, the associated RPD was within limits, and this analyte was not detected at or above the RL in the associated samples. Responses exceeding the instrument's linear range were observed for a number of analytes in the MS/MSD of 231GW10 (lab # 185457-009). High % difference was observed for calcium in the serial dilution of 231GW10 (lab # 185457-009). No other analytical problems were

Metals (EPA 6020):
encountered.

Ion Chromatography (EPA 300.0):
No analytical problems were encountered.

Alkalinity (EPA 310.1):
No analytical problems were encountered.

Sulfide (EPA 376.2):
No analytical problems were encountered.

Total Dissolved Solids (TDS) (EPA 160.1):
No analytical problems were encountered.

Total Organic Carbon (TOC) (EPA 415.2):
No analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: 185381 Date Received: 3-8-06 Number of Coolers: 5
Client: Treadwell + Rolle Project: Presidio

A. Preliminary Examination Phase
Date Opened: 3-8-06 By (print): Troy Windsor (sign) Troy Windsor

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES (NO)
   If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... (YES) NO
   How many and where? 1 per over cooler lip Seal date: 3/8/06 Seal name: Illegible
3. Were custody seals unbroken and intact at the date and time of arrival? ..... (YES) NO
4. Were custody papers dry and intact when received? ..... (YES) NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... (YES) NO
6. Did you sign the custody papers in the appropriate place? ..... (YES) NO
7. Was project identifiable from custody papers? ..... (YES) NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C. ..... (YES) NO
   Type of ice: Wet Temperature: 3.1 2.4 2.1 Cold (no temp blank) 3.6

B. Login Phase
Date Logged In: 3-8-06 By (print): Troy Windsor (sign) Troy Windsor

1. Describe type of packing in cooler: In ziplock type bags
2. Did all bottles arrive unbroken? ..... (YES) NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... YES (NO)
4. Did bottle labels agree with custody papers? ..... (YES) NO
5. Were appropriate containers used for the tests indicated? ..... (YES) NO
6. Were correct preservatives added to samples? ..... (YES) NO
7. Was sufficient amount of sample sent for tests indicated? ..... (YES) NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... (YES) NO
9. Was the client contacted concerning this sample delivery? ..... YES NO
   If YES, give details below.
   Who was called? _____ By whom? _____ Date: _____

Additional Comments:
B3- Sample -019 one vaa without a label (logged in as that sample because it was in a bag with five other vaas all of which were labeled.

QC Flag Legend

a - Target compound detected but, quantitated amount Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount exceeded maximum amount.
M - Compound response manually integrated.

DLM 3/11/06

	Mfg & Lot# / LIMS # / Time	Date/ Initials
0.02 mL of surrogate solution was added to all samples	S27198	CFL 3/10/06
0.025 mL of matrix spiking solution was added to all spikes	S2744F	
☑ Samples continuously extracted with about 450 mL of CH_2Cl_2	EM46014	
Extraction Start Time:	1132 / *1152	
Extraction End Time:	0605 / *0605	DLM 3/11/06
☐ Samples were extracted 3 times with 60 mL of CH_2Cl_2	NA	
Extracts filtered through baked, CH_2Cl_2-rinsed ~~powdered~~ granular Na_2SO_4	EM45118532	
Exchanged 2x with Hexane	CP890	
Concentrated: ☑ to volumes as noted above ☐ to clean-up volume	✓	
Clean-up (if necessary): ☐ GPC (see GPC run log) ☐ Florisil	NA

Calibration Table

==========

NEW ICAL. 14 NOV 2005

HPLC04 METHOD 8310

Calib. Data Modified : 11/14/2005 4:07:02 PM

Calculate : External Standard
Based on : Peak Area

Rel. Reference Window : 1.000 %
Abs. Reference Window : 0.200 min
Rel. Non-ref. Window : 1.000 %
Abs. Non-ref. Window : 0.250 min
Do not use Multiplier & Dilution Factor with ISTDs
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Ignored
Weight : Equal

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal 1: DAD1 A, Sig=254,4 Ref=480,80
Signal 2: DAD1 B, Sig=305,4 Ref=480,80
Signal 3: FLD1 A, Ex=273, Em=323, TT

LIMS Batch No: 111149
LIMS Analysis: 8310
Extracted by: KMH 3/9/06 JOM KMH
Date Extracted: 9 Mar 06

Extraction Method:
- ☐ EPA 3510c sep. funnel
- ☒ EPA 3520c cont. L/L
- ☐ _____

Cleanup Method (if needed):
- ☐ EPA 3640a GPC
- ☐ EPA 3630c Silica Gel

Sample # & letter	Volume of Sample (mL)	Sample pH	Final Volume (mL)	Cleanup (x if needed)	Comments

~~BHD~~ 3/10/06

	Mfg & Lot# / LIMS # / Time	Date/ Initials
0.1 mL of surrogate solution was added to all samples	S2841E/AD	KMH 3/9/06 JOM 3/9/06
1.0 mL of matrix spiking solution was added to all spikes	S2884/C	↓
☒ Samples continuously extracted with about 450 mL of CH_2Cl_2	EM46014	↓
Extraction Start Time:	1235	
Extraction End Time:	0645	DLM 3/10/06
☐ Samples were extracted 3 times with 60 mL of CH_2Cl_2	NA	
Extracts filtered through baked, CH2Cl2-rinsed ~~powdered~~ granular Na2SO4	EM 45118532	
Exchanged 2x with Acetonitrile	EM 45216	
Concentrated: ☒ to volumes as noted above ☐ to clean-up volume	✓	
Clean-up (if necessary): ☐ GPC (see GPC run log) ☐ Silica Gel	NA	
Extracts filtered with 0.45 um PTFE syringe filter	Whatman LZ17

CASE NARRATIVE

Laboratory number:	**185408**
Client:	**Treadwell & Rollo**
Project:	**2893.04.51**
Location:	**Presidio**
Request Date:	**03/09/06**
Samples Received:	**03/09/06**

This hardcopy data package contains sample and QC results for eleven water samples, requested for the above referenced project on 03/09/06. The samples were received cold and intact. MBAS analysis was cancelled for samples DAESP03 (185408-008) and DUP0308063A (185408-009) due to inability to meet hold time per J.Graber.

TPH-Purgeables and/or BTXE by GC (EPA 8015B and EPA 8021B):
No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015B):
No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
No analytical problems were encountered.

Pesticides (EPA 8081A):
High response was observed for methoxychlor in the ICV analyzed 03/03/06 19:07; average ICV drift met method requirements, and this analyte was not detected at or above the RL in the associated samples. Low responses were observed for 4,4'-DDT in the CCV analyzed 03/13/06 12:02 and the CCV analyzed 03/16/06 00:28; average CCV drift met method requirements. No other analytical problems were encountered.

Polychlorinated Biphenyls (PCBs) (EPA 8082):
High response was observed for Aroclor-1260 in the CCV analyzed 03/12/06 18:13; this analyte was not detected at or above the RL in the associated samples. No other analytical problems were encountered.

Polynuclear Aromatics by HPLC (EPA 8310):
Low recoveries were observed for benzo(a)pyrene in the MS/MSD of DAESP03 (lab # 185408-008); the LCS was within limits, and the associated RPD was within limits. No other analytical problems were encountered.

Metals (EPA 6020, EPA 7470A, and SM 2340B) Water:
Low recoveries were observed for calcium and manganese in the MS/MSD of BB3SW104 (lab # 185408-010); the BS/BSD were within limits, and the associated RPDs were within limits. Responses exceeding the instrument's linear range were observed for a number of analytes in the MS/MSD of 600GW101 (lab # 185408-002), the MS/MSD of DAESP03 (lab # 185408-008), and the MS/MSD of BB3SW104 (lab # 185408-010). High % differences were observed for many analytes in the serial dilution of DAESP03 (lab # 185408-008). No other

Client:	**Treadwell & Rollo**
Project:	**2893.04.51**
Location:	**Presidio**
Request Date:	**03/09/06**
Samples Received:	**03/09/06**

Metals (EPA 6020 and EPA 7470A) Filtrate:
High recoveries were observed for magnesium and sodium in the MSs of DAESP03 (lab # 185408-008); the BS/BSDs were within limits, and the associated RPDs were within limits. No other analytical problems were encountered.

Ion Chromatography (EPA 300.0):
No analytical problems were encountered.

Total Cyanide (EPA 335.2):
No analytical problems were encountered.

Alkalinity (EPA 310.1):
No analytical problems were encountered.

Sulfide (EPA 376.2):
No analytical problems were encountered.

Total Dissolved Solids (TDS) (EPA 160.1):
No analytical problems were encountered.

Total Organic Carbon (TOC) (EPA 415.2):
No analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: 185408 Date Received: 3-9-06 Number of Coolers: 5
Client: Treadwell & Rollo Project: Presidio

A. Preliminary Examination Phase
Date Opened: 3-9-06 By (print): Troy Windsor (sign) Troy E Windsor

1. Did cooler come with a shipping slip (airbill, etc.)?..... YES (NO)
   If YES, enter carrier name and airbill number:
2. Were custody seals on outside of cooler?..... (YES) NO
   How many and where? 1 over cooler lip Seal date: 3-9-06 Seal name: Illegible
3. Were custody seals unbroken and intact at the date and time of arrival?..... (YES) NO
4. Were custody papers dry and intact when received?..... (YES) NO
5. Were custody papers filled out properly (ink, signed, etc.)?..... (YES) NO
6. Did you sign the custody papers in the appropriate place?..... (YES) NO
7. Was project identifiable from custody papers?..... (YES) NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C. ..... (YES) NO
   Type of ice: Wet Temperature: 2.7 2.1 2.8 2.4 3.0

B. Login Phase
Date Logged In: 3-9-06 By (print): Troy Windsor (sign) Troy E Windsor

1. Describe type of packing in cooler: In ziploc type bags
2. Did all bottles arrive unbroken?..... (YES) NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)?..(YES) NO
4. Did bottle labels agree with custody papers?..... (YES) NO
5. Were appropriate containers used for the tests indicated?..... (YES) NO
6. Were correct preservatives added to samples?..... (YES) NO
7. Was sufficient amount of sample sent for tests indicated?..... (YES) NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below..... (YES) NO
9. Was the client contacted concerning this sample delivery?..... YES NO
   If YES, give details below.
   Who was called? By whom? Date:

CURTIS & TOMPKINS INITIAL CALIBRATION FOR 185408 GCVOA Water: EPA 8015B / EPA 8021B

Inst : GC05
Calnum : 316013420001
Units : ng

Name : TFT/BFB
Date : 09-JAN-2006 12:00
X Axis : R

Reviewer: MCH
Inj Vol : 5000 uL

Level	File	Seqnum	Sample ID	Analyzed	Stds

Curtis & Tompkins Laboratories Sample Preparation Summary 16-MAR-2006 18:11

Batch Number : 111348
Date Extracted: 15-MAR-2006
Extracted by : Jessie O'Brien Mee
Prep Method : 3520C

Analysis : N/A
Bgroup : TEH
Units : mL
Clean-up :

Spike #1 ID : S2903A
Spike #2 ID : S2826A
Spike #3 ID :
SOP Version : TEH50LL_rv10
